I am trying to complete a project that calls for Zetex FZT600 NPN darlington transistors. These are in the little surface mount package called SOT-223. Need 10 but would take 20 or so if I could find them. Local distributors are quoting 8-12 weeks!

Please reply via e-mail. Thanks for any suggestions

No, they are NOW charging $20.00 a year.
It was $12 about 2 years ago, then he went up to $15 and now $20 with
talk of going to $25 according to one person who wrote to me.

NOW, with 600+ people sending him $20 each he is not doing too badly
at all!

Every other LIST is FREE!

To subscribe to the FREE BOATANCHORS list at TEMPE, send a message to:

I had a similar problem, but attaching the coax directly to the antenna input proved worthless. What did work was to open the boom box, disconnect the whip antenna, and substitute a 75/300 ohm coax to twin lead adapter. I grounded the other side of the twin lead to a convenient IF can. A hole thru the back of the boom box and some epoxy to secure the adapter completed things.

This proved quite effective in adapting the boom box to cable, and particularly effective when using a coax-fed antenna up in the mountains. In the latter case, the boom box went from useless to almost full quieting on stations greater than 190 miles distant.

The boom boxes I adapted this way were PLL-types made by RCA.

Hi Everybody!
My highschool seems to have developed an interest in the idea of
building an on-campus local FM radio station. So I, being a bit of a geek,
have decided to take it upon myself to attempt to compile all information
possible on the subject- what equipment is needed, what FCC liscences are
necessary, where we could possibly look for grants, etc. So, if anyone has
any useful and valid information on the subject, please reply. Thanks.
-Ian the Grate

PS Also, what is needed to pass the FCC tech test(age requirements, degrees)?

I believe 2N4391, 2N4392 & 2N4393 were very popular FET's
in industrial equipment. They should cross to SK or ECG
and be readily available. Take Care, Kevin

# 2909. Low current power supply IC's?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-24 00:00:00 UTC
From: w1_k_sorter@qsl.net
Message-ID: <609vrf$8g2@news2.tds.net>
Source record: 90673

Hi Everyone,

I'm looking for some high tech PS chips. I need something that will run on batteries that will produce regulated -100 to -200 volts @ 1 to 100 ua.

I need high effeciency! A conventional saturated switching core step up transformer won't do it-they waste too much power because they aren't made to produce such low output currents.

Maxim and Microliner make fine switching supply chips for very reasonable prices! They use variable pulse frequency as the load increases, in order to maintain high effeciency at low to moderate current outputs. When the current required increases further, they switch over to pulse width operation. When the device achieves regulation, it shuts down EXCEPT for the output monitoring function (where they daraw 20 to 100 ua supply current in standby). This achieves even greater effeciency over a wider range of output currents. Unfortunately, these devices aren't made to provide 100 v output (most are 3 to 15 volt outputs), and they are not made to supply currents less than one or 2 ma -below that, they get very ineffecient.

Does anyone know of a vendor that makes high tech power supply chips for very low output currents?

Thanks...

Art...

>Thank you-
>KQ6JG

Hi Michael,

The subscription price has gone up a little. Please send me $150 for a six month subscription to each group, and get all your friends to do the same. I see you are interested in four groups, so that's $600. I know it seems like a lot of money, but look at all the great posts your current trial membership is bringing you. You wouldn't want to get cut off and lose all that, would you? So send the $600 today, in $10 and $20 bills. I'll credit your next six month subscription $5 for every friend you get to sign up!

Thanks,

Elmer

Needs the I.F. coils replaced and or repaired. Front panel is collector quality. Over all condx is a 9.5. A worthwhile investment if you have the time to fix. I have the W7FG manual (very thick, high quality), and a large roll out master scat. I picked this up because it looks extremely nice but i have too many other projects.

$125.00. You pay shipping from san diego zip 92139. Weighs ~ 105 pounds boxed up.

I'd guess the MPF-102 would be the leading candidate for a 2N2222-style "generic" N-channel JFET. P-channel JFETs are rarely used at the discrete-device level; they do exist, but no specific type #s come to mind.

For casual RF work, the 40673 is an ancient, cheap, and still-passable dual-gate MOSFET. There are better parts, but I've always been fond of the 40673 for some reason.

Low-to-moderate power FET designs often use the VN67AF or VN10KM devices (Radio Shack used to sell these off the rack, in fact). Plenty of other options here, too.

Build an audio oscillator. Use a transformer to raise the voltage to
-200V RMS.
Rectify the result (full wave!) and filter with a capacitor of good low
loss characteristics. Build a regulator to stabilise the output feeding
back to the
audio oscillator drive.

That is the way my CRO works, 12V in, 3kV out, tripled to 9 kV.

Alternatively, buy a 200V battery.

# 2915. Re: Looking for modifications on Kenwood TS 780 VHF/UHF all mode base rig

<pleun.vermeulen@prive.ordina.nl> writes
>I'm am desperately looking for modifications on Kenwood TS 780 VHF/UHF all
>mode base rig!
>
>I want to:
>
>- Extend the RX range (want to be able to receive around 150 MHz)

NOT ADVISED - One of the advantages of the TS780 is that it was designed
to receive signals within the ham bands only. Extending the receive
coverage wiuld give you problems from break through of out of band
signals (pagers etc.)

>- Improve RX sensibility (is quite OK but if possible better RX would be
>nice)

Use an external mast head pre-amp.

>- Pump up the HF power if possible (is now 10 watt, I've heard that 3dB
>gain is possible)

Specification is 12 watts. 17 watts is possible but again not advised.
The difference is not going to be worth the risk of running out of spec.
If you must "have a go", remove the top cover and locate the TX board.
(second board from heatsink) VR1 adjusts the high power setting on 144
and VR2 adjusts the high power setting on UHF.

>- Setup the Signal meter properly (The needle's a bit heavy.. hi)

Setting up the signal meter properly involves a number of adjustments
and should not be tackled without a service manual. If you just want to
see a more active "S" meter the pre amp will do that for you.

>- Change the "low power" settings (should be 1 watt, is now 180 mW)

VR4 on the 430 final board (next to the heatsink) controls low power on
VHF. VR5 on the same board controls low power on UHF.

>- Built in CTCSS (To open "modern" repeaters)

Boards or kits should be available from most good dealers.
>
>The Kenwood TS 780 is a 80's VHF/UHF set, please be so kind to review your

>
>Pleun (PD1ADI locator JO21WT)
>
Nice to see you want to "have a go" but don't rush in where others fear
to tread! You have an excellent base station and it is all too easy to
adjust the incorrect component if you don't have a service manual. Good
luck and look forward to working you soon.

WE HAVE ONE PRODUCT "CIGAR BOX" INCLUDING A HAND HELD TORCH WITH 2400F
(1300C) TEMPERATURE FLAME, 3PCS CIGAR HOLDER, AND ONE CIGAR CUTTER.

WE ARE THE MANUFACTURE IN TAIWAN. IF YOU HAVE ORDER QUANTITY MORE THAN
600 SETS, PLEASE CONTACT WITH ME. EMAIL :jama3649@ms7.hinet.net

IF YOU WANT TO DISTRIBUTE OUR PRODUCTS BUT QUANTITY LESS THAN 600 SETS,
PLEASE CONTACT OUR U.S.A AGENT
WAHL CLIPPER
MS.PAM GOESSMAN
EMAIL ADDRESS : pgoessman@wahlclipper.com

PLEASE MENTION YOU ARE INTRODUCED BY JACK LAI, YOU MAY GET GOOD PRICE
FROM HER. IF YOU ARE INTERESTING IN CIGAR TORCH, PLEASE ALSO CONTACT
WITH HER OR EMAIL TO ME.

BEST REGARDS
JACK LAI

I think that one of the electrodes would actually have been the gas
nozzle, rather than the flame itself. The flame would correspond to the
electrons in a conventional valve/tube. There used to be a device called
a thyratron that used ions - it was basically a gas-filled triode, with
similar characteristics to an SCR or thyristor (named after the earlier
device).

I've just remembered another interesting electronic flame application!
Someone once developed a loudspeaker using one - called the Ionophone.
How about using De Forrest's flame detector in a radio with an Ionophone
for the audio output. 8-)

I wouldn't pay $600 for any subscription! That's equivalent to the cost
of several homebrew transceiver projects for me.

From: daveb@buffnet.net
Message-ID: <60as76$ek2$1@buffnet2.buffnet.net>
Source record: 90683

Greetings,

Have a Henry Tempo 2002 2M amp that may need tubes in the near future.

Has anybody replaced the 8874s with a single3CX800A7 ?

Would like to hear from someone who has done it.

Thanks

daveb@buffnet.net

# 2920. Re: Oscilloscope prescaler

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-24 00:00:00 UTC
From: w7el@teleport.com
Message-ID: <60ajja$kjo$3@news1.teleport.com>
Source record: 90684

Sorry I missed the original message -- the responses have been interesting.

A "prescaler" in the digital world converts a two-level signal to another two-level signal of lower frequency. Virtually all the information about the original signal, except frequency, is lost. So this wouldn't be very useful with an oscilloscope, since you can measure the frequency in several other ways which are probably easier. An oscilloscope is used when you want to know other things about the waveform than just its frequency.

There are a couple of ways you can time-scale (down-convert) an analog signal while retaining its fidelity. One is to use a heterodyne converter, that is, make a superhet receiver and look at the IF with the 'scope. The disadvantages of this approach are the many possibilities for signal distortion in the conversion process, and that the input signal must be band-limited in frequency. Another way is by equivalent-time sampling. This is the method used in many sampling 'scopes. It does a true time-scaling of the input signal -- that is, the output is a replica of the input but slowed down. There are two common methods of doing this, known as random and sequential-sweep sampling. While both are simple in principle, making a clean sampling system is an exacting science. I know -- I've been there and done that. A brief explanation is given in _The XYZ's of Oscilloscopes_ by Tektronix. I believe it's still in print, and you should be able to get a copy by calling your local Tektronix field office.

Helmholtz, in 1869, invented the Helmholtz Pendulum. A switch attached to the pendulum would sample a waveform whose frequency was much greater than the pendulum frequency. By choosing the pendulum rate slightly different than a subharmonic of the waveform he could make a paper strip chart recording of the waveform. Hund, High Frequency Measurements, 1933.

I am now using a push pull amplifier using MRF586's with about 6V DC
collector to emitter and about 2 dB of voltage feedback. A ferrite
xmission line twisted-wire choke (type FT37-43 core) feed to the
collectors is then capacitor coupled to the floating Mini-Circuits
SRA-3H L.O. terminals. The balance is quite good and the wave shape is
reasonably square from 12 to 40 MHz. I use two-tone intermod tests to
evaluate the L.O. quality and I meet Mini-Circuit's specs over the freq
range.

Standard product xtal filters are readily available from multiple sources
at frequencies like 45MHz, 70MHz, 75MHz, and 140 MHZ ... and more,
but those are some of the most common freqs.

As a further suggestion, people inviting others to look at their home page could include a few lines telling the reader what their home page is about - eg QRP, homebrew, CW, VHF or operating. This is so the reader can determine whether they are likely to be interested in its contents without having to go to the page itself.

Every time someone announces a new home page without a description, I ignore the message and don't look at their page. When people include a brief description, my interest/curiousity is aroused, and I'll often look at it. I think there's many other readers who think similarly.

If people are talking about using spam filters but don't want to pay
for the connect/download charges, why not create filters that will work
at the ISP's system? That way the ISP could simply reject the message
before it ever got to the hard drive. If you wanted to get really cute
you could even reply automatically that "This address does not accept
SPAM" so that the incoming volume might (hopefully) diminish eventually
when spammers realize that their messages are being blocked.

> Would like to hear from someone who has done it.
>

I think you will find it rather difficult. The 2002 uses a pair of 8874s
in
push pull. You want a single 3CX800. You may find it easier to convert
to a pair of 3CX800s but keep the power down. You can't use 4CX250s
even with a screen supply as the isolation and cooling are just not up
to it.

It is possible to use a single 3CX800, but you will need to replace the
entire
anode circuitry with a 1/4 wave line type system, as in the ARRL
handbook.

And that means you can feed them directly to a FM radio (or FSK radio,
same difference if response is true FM). All you need is adequate modulator
bandwidth (and adequate bandspace). In practice, I think you want to operate
at 10 GHz. Gunnplexers can easily handle video rate signals (about 6 MHz
bandwidth), and should stretch to handle 10 Mb/s data streams without any
fancy tricks.

Of course you could use a more complex modulation and reduce the bandwidth
required, but at the cost of much increased complexity.

The MPF-102 is a very poorly graded FET with Idss sometimes varying over range of 10:1. The 40673 was a pretty fair MosFet, but has been unobtainium for several years.
My best offer would be the JFet J-310. UHF device, works to DC, and Future Electronics sold me my last 100 at $19.00 a hundred.

Hi Bill, somebody snipped my whole second response out of this thread, then gave me credit for it!

I too favor the square wave drive. As long as you minimize the switching time, I'd use Impulse functions if I could lay my hands on a string of them!

By the way, doing a lot better than using 5 GHz bipolars in push pull with Wes's "neither fish nor fowl" gate source feedback fet amplifiers using quad J-310's. Neutralize it with a drain feedback winding, and get noise figure under 1.5 dB, input return loss greater than 30 dB, output return loss greater than 20 dB, 12 dB gain and reverse gain greater than -55 dB. Ip3 is +24 input, and my intermod limit is now the coils in the antenna filter. Part of it is the construction of the feedback transformer, I'd be happy to make you up one for you to play with as a partial payback for "The solid-state receiver." Works pretty well for $0.80 worth of devices.

Thanks anyway Harold, but on the project I'm working on I am doing my own circuit designs and doing my own thing. Sometime in the next millenium or two I will have a completely homebrew 150W bandswitching Xcvr, 160 to 10, SSB/CW. Not state-of-the-art specs, but using as many parts on hand as possible (e.g., MRF586's) with compromises of one kind or another.

Yes I understand that commerical products are available but as I want to homebrew a low VHF IF I was wondering how they are built and if it was possible to make one like you would a regular crystal ladder filter using overtone crystals?????? As with most at home projects its hard to get small quanities of nonstandard parts and I have more time than cash.

Despite what anyone says about the technology, these old rigs represent the utimate in quality. Back in the days when you could call up the manufacturer and actually talk to the engineer- in contrast to today then you get some marketing guy who has to be threatened before he will even send a schematic. And passes the buck to some guy in Japan at the slightest hint of criticism.

Commonly overtone crystals are used in ladder filters in very high quality (note I'm not talking about ham gear) 800mhz gear like police radios. I have several Toshiba radios that use an IF near 42mhz via a 3 pole ladder filter.

However, realize that normalized Q is very low for a VHF crystal filter when compared to the lower HF equivalent. Thus wide BW's are used so that receiver noise figure is not compromised.

This is the bane of up-conversion. The need for a wide roofing filter that guarantees that inband IMD will be awful. See the Sherwood Engineering web page if you need proof of this.

I believe that a much higher quality receiver can be made by mixing down a VHF synthesizer into the HF region. I have shown this with a hybrid DDS/PPL, but its questionable whether its very useful for homebrewers, since you need basically a computer to crunch the math as the tuning knob is turned.

Chris,

This doesn't answer your question about DeForest's setup, but it
is a related application, I'd wager...

Years ago, I built what might be described as a flame speaker. The
premise was that any flame is composed of (among other things)
very excited ions (a plasma). It should therefore conduct
electricity. Also, the flame occupies a volume of space.
Imposing a current on the flame should make the volume vary
proportionally to the current.

I used an acetylene torch for the flame. I used a wick in a
saturated solution of sodium chloride to "dope" the flame at it's
base to add extra ions. The circuit was simple. I needed a high
voltage power supply (I used 2 kv DC), a macho audio transformer,
an audio amplifier (rated at 100 watts into 8 ohms) and the flame.
The audio amp output was wired into the 8 ohm secondary of the
audio transformer. The primary was wired in series with the HV
power supply, and the flame. The "connection" to the flame was
done with some nichrome wire scavenged from an old toaster, which
had been straighted and inserted into the flame spaced about
2 inches apart. If you drove the setup hard enough, you could
easily hear audio coming from the flame. It totally lacked low
frequency content and had a distracting signal to noise ratio due
to the sound of the flame itself trashing the noise floor. But it
was fun to do. (Excuse me while I light the speakers...).

There was an article about this project in one of the electronics
magazines (maybe Popular Electronics) in the late 60s or early 70s.

W.Worley, the best place to find this kind and quan. is at a motor
rewind shop. They usually scrap the ends of rolls which are too short to
do a complete motor as all windings are done with out splices. Just go
to one and plead your case that you are an expermenter/ham and need a
small quanity to do a project.
They'll prob. give it to you. or charge you their price per lb.

Bill, This is a new response to your old post, but I want to pass on some info on the ferrite bead choke balun to try to show that it is more than just an RF choke. An article in QST (March 1983, p. 38) describes two such baluns, one for the 1.8 to 30 MHz bands and the other for the 30 to 250 MHz bands. Using a balance measurement technique, the output terminal imbalance for these baluns was found to be "undetectable". The ferrite beads provide a high impedance to possible currents on the outer shield surface, so equal currents on the arms of a dipole are maintained. Of course, the effectiveness of a ferrite bead choke balun depends on the type of ferrite, the number of beads, etc., etc. 73, Bill N3WK

OK, I'll bite. I have designed audio amps using the 6080 tube directly
driving speakers. I'm not sure if that qualifies me as an expert or as one
of the criminally insane :) But I have used common plate circuits.

According to all that I have read, common plate for RF power amps is
viable. Has as good freq response as anything else.

But in this case drive needs to be from Vcc down to -Vcc, thus centered at
0v. In most RF amps, drive is from 2Vcc to 0v. Anything higher produces
excessive grid currents.

Other than the drive considerations, I can't think of why it wouldn't work.
Please keep us informed.

>Bill W0IYH

This is the technique currently called "sequential-sweep" sampling. A stroboscope provides a good example. If you look at a turning fan with a stroboscope exactly synchronized with the fan, it'll appear to be standing still. If you change the strobe frequency just slightly, the fan will appear to turn slowly. What you see is a replica of the actual fan motion, but scaled in time.

Oh, one thing I didn't mention in the previous posting. Equivalent-time sampling methods require a periodic waveform -- they won't work with a single-shot event.

Thanks for the history lesson. I knew the technique was very old, but didn't know its origin.

I have obtained a power transformer manufactured by American Monarch
Corp. Minneapolis MN 55421.

I have had no luck finding an address (either E-Mail or snail mail)
to get the details of this transformer.

Its details are as follows:-

AM No H504731A
Cust No 3181-9.659
REV./EC B
00D044 83??

It is out of a Burroughs B90 Computer and has a 7.5Amp 240 volt input.

If anyone can help with either an E-Mail Address, a snail mail address
or details of the transformer, I will be extremely greatful.

73's and thanks in anticipation

Hi Bill, the beauty of this device is that it chokes currents on the
outer shield (the common-mode currents) and it doesn't matter if it
is working into a balanced load or an unbalanced one. I use one in my
mobile configuration and I wouldn't call it a balun in that case
although it is physically identical to the "balun" I use on my dipole.
It is always a choke. Whether it functions as a balun or not (unun)
depends on how it is used.

Ceramic resonators are essentially crystals. Even the Radio Shack
DX-394 use a 45 MHz ceramic resonator as a filter.

I wouldn't exactly call the old rigs the ultimate in quality, though some of the gear intended for the military did use top quality parts. Most of the stuff intended for the amateur market, however, suffered from serious corner cutting. And the circuit designs, sigh, they were so limited by the number of active devices they could include that the designs were always seriously compromised (and that includes prestige makes like Collins).

You can still call up the manufacturer and talk to the designer(s). But it may be an international call, and it helps if you speak Japanese. (Don't bother calling the US reps with technical questions, they're just sales droids.). I've had occasion to consult the Japanese manufacturers about various equipments, both professional and amateur equipment. I've found them to be uniformly friendly and helpful if you can overcome the language barrier. I have an in there. One of our staff speaks fluent Japanese, and can act as translator. I've even had them return my calls, on their nickel. Like design engineers anywhere, they just love to talk shop.

Hey Mike,

Interesting concept, but... In order to make it work without alot of
wasted power, it has to charge a cap, then shut down till its needed
again (which is what the inductive kickback single chip controllers
do).

Your voltage monitoring IC alone is going to consume 2 or 3 ma of
supply current all by itself, isn't it? Then the audio oscillator has
to operate class ab-20 percent effecient at best, plus it runs all the
time, even if the output current requirements are met, doesn't it?

I had a temp lashup for this using a high linearity dual transistor
descrete component (twin T, high impedance output type) oscillator,
and I couldn't get the quiescent current down to less than 4 ma (thats

without load or voltage monitoring overhead.

Also, the transformer needed to do this right isn't a dimestore item,
and would have to be designed and built custom. The transformer design
is no small task. A hugh core from an existing piece of switched power
supply gear won't make it...

Can you tell me how much quiescent current your circuit draws and give
me some other details? I have become aware of some comparators that
use very low supply currents, but not sure if they have the necessary
HIGH input impedances to make the voltage regulation work without
loading the output. Also, I need to avoid the audio range, it needs
to work at 10X audio range, 50 to 100khz is the minimum design
frequency.

Very much appreciate the assistance, and I hope I missed something in
my initial evaluation of this method.

Can you enlighten me further?

I can accept email attachments if you have the ability to send the
schematic via email.

Again, many thanks..

Art.

To get rid of (most of) the flame noise, use a quiet low pressure burner
instead of the acetylene torch. And to get low frequency response, use a
larger burner unit and adjust for a long soft flame. A "gas log" burner,
or the burner out of a gas grill, will work best. You can get quite respectable
sound out of these things.

Have read all the posts on this-

Please realize-when I say 'attack' the spammers computer, I don't mean to send it signals which will do physical harm to the spammers computer!!!!

'Attack' means to use hacking techniques, UDP specialized commands sent via the network, polling-any low thruput command sent via the network that causes the target computer to take time to process it, and that DOESN'T genearate a reply meets this criteria.

This limits the spammer computers ability to send spam for a short time!

The second phase is to generate an online site that lists up to the minute spammer domain names-if the spammers domain operates for more than a month sucessfully, then move up to the spammers HOST computer, and re-attack! The info on WHO to attack would be held on a central database, available to all. Then get the authors of various internet software packages to generate these commands at random during periods of NO/LOW thruput by the user!

This way, we could all participate-think of how long some of us are on the internet without really inputing data or downloading data. If our apps would issue a command like this twice per second (we'll say), it would be a powerful antispamming tool-because EVERYONE would be doing it!!!

Sick of spam?

Let's take OUR internet back. Run these fukers out of biz!!!

What Say?

de K.

PS-no local dialup ISP-still paying 9 cents per minute to download spam! Pissed, you bet I am!

One problem with vacuum tube HF ham receivers was the noise figure mania. Hams thought that if an HF receiver didn't have a 5 dB noise figure it was not very good and would not buy it. As a result, strong signal performance suffered because of vac tube limitations. Special tubes like the 7360 beam deflection tube (Squires-Sanders SS-1) showed up just as the transistor age began to take over, but by then it was too late.

That was certainly informative.

I think he's referring to a functionally equivalent part from another
manufacturer. The term probably derives from the cross-reference tables
used to find functionally equivalent semiconductors.

But what do I know, I'm just a programmer.

Hi Cecil, there are some other nice features - it's extremely easy to put one together, and it does the job of suppressing currents on the outer shield without modifying the radiating system itself. I tried putting together a 4:1 toroid balun, and was never happy with it, I think because the added inductance of the toroid winding changed everything. 73, Bill N3WK

The battery idea is very practical for this application (and the
preferred method IMHO), but I have searched far and wide for 100 to
200 volt batteries or cells that could be put in series.

Best I could do was some 1.2 volt ni-cad coin cells, but they cost
over a dollar each, and I need ALOT of them to make 200 v!

If I could find appropriate batteries for a reasonable price, I would
buy them and be happy!

A proper battery (rechargable) would be the best answer by a longshot.

I only need 5 ma hour capacity, but they would have to be
rechargable-or else VERY VERY cheap! I don't see any way to justify
the high expense of a battery purchase unless it is rechargable.

Ideas?

Many thanks...

Art...

I started this when I replied about missing K-town. We need to get all the folks on the net who were in the K-town area and email each other.

BTW, Sembach does not have aircraft working out of it. It is used as a secondary site. Some of the old hangers are being used as commercial go cart racing. It is great fun!! (So much easier to have recreational activities when the lawyers are kept at bay.)

Thanks for reading this message.
I am looking for plans on building a dual band base antenna. I saw one that someone had built and was selling at a hamfest. It had dual 5/8 wave elements on 440 and was a shortened 5/8 wave on 2 meters. The antenna used two coils one of which was shunt fed(the bottom on which I believe had 8 turns on a 1/2" form. ) Any Help would be appreciated. It can be posted to the newsgroup or directly to me. 73

:to talk shop.
:
:Gary

Gary, your experience has been much different than mine.

(repeated from another NG)

I was seriously thinking of buying an ICOM 775. I asked the sales person if I could look at the schematic. I've never seen a schematic that looked like that. It was obvious that they were trying to keep the consumer from figuring out how the rig worked. Obviously, the designers were embarrassed with the design. Any designer worth his salt will go to great lengths to make it readable, so that the design inovations were more apparent. Not in this rig. Garbage, pure and simple.

Now, even though the US manufacturers cut corners, etc in those old rigs, the new Japanese rigs still pale in comparison. After all, there is no rec.radio.amateur.japanese newsgroup, now is there??

## 2983. Inductance calculations

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-25 00:00:00 UTC
From: Diamond Jim <koehler@mars.ark.com>
Message-ID: <01bcc9e3$656665e0$530232cc@DiamondJim.ark.com>
Source record: 90656

I recall, vaguely, seeing a comment in a magazine many years ago (perhaps 'ham radio') giving a better formuola for calculating the indcuctance of small air wound coils than the 'standard' equation which is very simple. Does anyone know of this one? The standard equation (i.e., the one in the ARRL handbook) was widely used in the olden days when we all just had slide rules. It seems to me that, with modern calculators, one might just as well use the more accurate equation.

Thanks,

Jim

I've seen the 7360 used in SSB balanced modulators, but hadn't considered
the possibility of using it in a receiver front end. I can see how it would be
a good first mixer.

But the real problem with the old designs is the limited number of active
devices which could practically be used. Because of the bulk and filament
power consumption, the number of vacuum tubes you could practically
squeeze into a radio was sharply limited. That meant that every circuit
was severely compromised because it had to met many, often conflicting,
criteria. With the ability to throw many more devices at the problem, each
can serve an optimized purpose. The total system is still a compromise,
but you can make better tradeoffs for the total system because you aren't
as sharply constrained by the characteristics of any individual device.

A modern radio often has millions of active devices in it. That allows you
to produce functions which were simply impractical in the tube days. Yet
the radio can be much smaller, and consume much less power. If we tried
to do that with tubes, the reliability would be so poor that it would never
work, and it would take a dedicated generating station to power it.

>Larry ve3fxq

I don't know that amateur radio is going anywhere new. There is an enormous resistance to change in amateur radio currently. But lets set that aside and see where the greatest impacts could be made by newer techniques.

I think it should be obvious that the entire communications world is moving in the direction of digital techniques. They offer us so much more capability that this is inevitable for any service feeling capacity pressure on its spectrum.

Now amateur radio doesn't feel the capacity pinch on most of its spectrum, so adoption of superior techniques has to be driven more by the desire for the novel than by necessity. But lets look at those areas of amateur spectrum currently feeling a capacity pinch, real or perceived.

The most obvious area of amateur spectrum feeling a capacity pinch is HF. Yet this is the area least likely to be open to innovative techniques due to tradition and regulatory limitations. SS could be of considerable benefit at HF, but that isn't likely to happen soon because of the mentioned social factors. But relatively narrowband digital methods may gain strength here in a number of different ways.

Clover and PACTOR II are already in use on HF, and they are likely to gain in popularity. Other protocols may be developed, but they will only be icing on the cake as to what can be done in a 500 Hz bandwidth under HF conditions.

We may see some movement in narrower bandwidth digital techniques, however. There are methods we could easily adopt which could carry 20 WPM equivalent signals in a 2.33 Hz occupied bandwidth. This would represent a large improvement over conventional OOK Morse signaling (because we could actually pack signals 2.33 Hz apart without adjacent channel interference by using ideal matched filter detection,

something we can't do with Morse coding). It allows a much higher packing density, and allows weaker signal work, so it should be of benefit to QRP operators. I've been doing some experiments in this area, the equipment needed for large performance gains is really simple, simpler than most current amateur equipment, though the frequency stability requirement is quite stringent.

On the other end of the narrow digital spectrum, if we could get some regulatory relief, we could fit digital voice in an ordinary SSB bandwidth. There are a number of advantages to doing this. We can work at a lower CNR, and we can gain a considerable immunity to adjacent channel interference. It also allows us to easily adopt adaptive power control, which would go far toward increasing total band capacity. This doesn't give us all the advantages of SS (in particular we don't get the freedom from multipath skywave fading that SS offers), but it avoids some of the perceived drawbacks (more political than real) of SS.

Another area feeling a perceived capacity crunch is 2m. This is the most popular and most heavily used amateur band. FM and repeaters dominate here, but there is a perceived lack of available repeater pairs. The spectrum is "full" to all intents and purposes in most areas. But it is very lightly utilized. We can do much better while preserving the social utility of repeater style operation.

One very obvious, but old, technique would be to convert to trunking operation. This would allow much better use of our repeater spectrum while imposing little in the way of new site costs. Trunk groups would simulate traditional repeater operation, but we could also implement smaller trunk groups for one to one contacts. Given the current repeater sites, this could allow wide area HT to HT communications for large numbers of amateurs at once (linked repeaters don't give us this, linking alone only allows a few amateurs to use the systems at once.)

A more ambitious step would be to move to cellular style operation. The drawback is many more sites are needed, but the advantage is that they don't have to be high sites, and are thus more likely to be available to amateurs either free or at low cost (many could be co-located with home stations). We can have much more frequency reuse using cellular style systems, allowing the number of amateurs to share the spectrum to be much larger. Multi-way calling could be arranged to simulate conventional roundtable activity.

Digital cellular would be the obvious extension of this idea, bringing with it the ability to operate at a lower CNR and with less co-channel and adjacent channel interference. The best way to implement a digital cellular system is with SS, but amateur politics (mostly ARRL opposition) seems likely to prevent this from happening on 2m.

A compromise position between traditional trunking and full cellular is to adopt ESMR methods. This gives us many of the advantages of cellular at a lower cost and with a somewhat lower technical complication. The commercial two way industry is moving rapidly in this direction. We

could too. In fact, ESMR may be the better way to go for amateurs for a number of reasons, including preservation of an ability to operate simplex if the host systems are down.

Due to legal restraints and continuing political opposition, SS is largely confined to the UHF spectrum. But amateurs have so much idle capacity at UHF that the sharing advantages of SS aren't needed there. So there isn't much likelyhood that SS will be widely deployed at UHF for the foreseeable future. About the only useful thing it brings to the table at UHF is relief from multipath fading, and that's only of real interest to mobile operators.

What we may see at UHF is much more point to point high speed digital operation. But that operation likely doesn't need to employ SS. (Though it may, using recycled Part 15 equipment.) With the large unused capacity that amateurs have at UHF and above, conventional wideband digital data transmission fills the bill.

The reason we may see much more high speed data operation at UHF is the desire of amateurs to provide high speed data MANs which can be linked by the internet to other MANs in other parts of the world to form amateur global virtual networks. And if trunking or cellular operation becomes popular, we'll need those MANs to provide the switching and linking needed for those activities too. Fortunately, computer power is now cheap and pervasive, so these switching systems are easily within our grasp.

(Note that this promises *global* HT coverage if implemented in conjunction with internet wormholes to form global virtual networks. We've seen hints of this with the use of internet phone to link pairs of conventional repeaters, but that only scratches the surface of what we could do. Note that we could use amateur satellite links in place of internet wormholes, but amateur satellite capacity is very limited, so it can only supplement, not substitute, for internet wormholes.)

Most of the things I've talked about for VHF and UHF require a degree of *cooperation* among amateurs which is often sadly lacking. So none of these things may be realized in practice, and we may continue to operate in the inefficient ways we always have until our bands are taken away from us because we have been warehousing valuable spectrum rather than utilizing it to the best of our abilities.

The latest Motorola handbook says that the MRF586 is "active" but not recommended for new designs. The suggested replaceement is the MRF5812, which is available in a pill or surface mount package. RF Parts has the MRF586 (TO5) in stock at about 4 bucks each.

I don't agree with that at all. Some excellent receivers were designed using a limited number of tubes. You don't make a receiver better by throwing more tubes into it. You make a better receiver by choosing the tube types carefully and then using them in an optimal manner in a carefully designed block diagram. This was a highly developed technology.

With vacuum tubes, more is not better. With RF integrated circuits the exact same thing is true.

Don't have the specifics on the antenna you saw, but an easy and sturdy
2m/70cm antenna you can build is a simple 2m 1/4-wave ground plane.
On 70cm, it works as a 3/4-wave vertical, providing (some) gain. No
coils, no taps, no mechanical monstrosities. Just a simple, effective
radiator.

Good luck & 73...

Not true. There is a "dot" matched filter, a "dash" matched filter and matched filters for the spaces in-between (all of them integrate and dump). These can be combined and decoded by algorithms. The code speed can be "learned" by the processor.

Unless something got clipped here, the original question was " is there
generic replacements for FET's ", something like a generic 2N2222.

You're back to bipolars Bill.

By the way, can you give me the reverse gain of your push pull pair with
voltage feedback? Just wondering how much isolation it provides against
filter impedance variations.

Boy, if we don't start getting accustomed to surface mount and 0.05 inch
centers, we're all gonna be appliance operators.

Building your own is very cheap and effective among amateur radio
telescopists!! See my web-ftp site's subdir and file: PHYSX/parabola.tut
and in your case mount it's axis on an equatorial mounting!!

Hi Bill, more than likely the reason that you were never happy with it is
that it was never happy with the impedance you tried to force it to tolerate.
Was the 4:1 balun load impedance somewhere around 200 ohms resistive? If one
doesn't know the answer to that question, one should never use a 4:1 toroidal
transmission line transformer. Especially for non-resonant length antennas,
the poor balun never sees anything close to 200 ohms. It's more likely to
see 20 ohms or 6000 ohms or something in between with lots of reactance.

Dual-band j-poles look pretty straightforward. There were plans for one in
QST a while back.

This discussion is going into orbit around some strange planet somewhere. The question was asked about a "cross" for a MRF586. I responded to that.

>
> By the way, can you give me the reverse gain of your push pull pair with
> voltage feedback? Just wondering how much isolation it provides against
> filter impedance variations.

More confusion. The MRF586 circuit that I described is an injection amplifier, +17 dBm to a Mini-circuits SRA-3H LO port.

For the amplifier that you are inquiring about I would not use voltage feedback for the reason that you mention.

However, if you put your test paper in the middle of the stack, I won't say anything.

: I'm looking for some high tech PS chips. I need something that will
: run on batteries that will produce regulated -100 to -200 volts @ 1 to
: 100 ua.

I'd have a closer look at Maxim and Linear Technology chips before giving up on them, but if they fail, you can do it with just some low power comparators and a "power" mosfet. I may have cut out a part where you say what battery voltage you are willing to start with, but if I assume something in the 7 to 9 volt range (a "9 volt battery"), then a little controller that consumes maybe 50uA or less of 9V power, coupled to the mosfet which pulls an inductor up to +9 and lets it fly back, should do the trick. The inductor flyback charges a cap thru a very-fast-recovery, 200PIV diode--chosen for low leakage, too. To keep current low, you need a very high impedance voltage divider from the -100 to generate the feedback that allows pulses to be generated or stops them. -- If you could stand the idle current of a tlc555, I can imagine a simple circuit using one of those and a P-channel power mosfet that would generate pulses on demand....I don't recall what the tlc555 idle current is, but think it's in the couple hundred uA region. You can also do a simple circuit with a dual comparator that will be roughly equivalent, and a tlc393 only draws about 40uA. Obviously the efficiency is rotten at 1uA output, but at 100uA output, it should be pretty good, since that corresponds to about 1.1mA at 9 volts, at 100% efficiency.

Cecil, would I say a nasty thing like that? *u know I wud not*. My statement stands exactly as you quoted it. Please don't embellish it, OM. I assure you I am rather knowledgeable about signal processing principles. Systems such as I have described have been designed and built, although I don't recall exactly where I read about it a long time ago. It may have been Wireless World. The Brits, like Ian, are always thinking up things like that.

: over a dollar each, and I need ALOT of them to make 200 v!

Oh, if batteries are a viable alternative, go with cheap "9V" batteries.
They are trivial to stack, just plug them together! You can go
rechargeable; I believe Costco has 7.2V (6-cell) NiCd's for around
$3 each, maybe less; and you can get the alkalines which start at
about 9.5 volts fresh for much less. Since they are about 500mAH,
they should last a very long time, if your average current is
in the 20uA range. In fact, if that's the case, I'd recommend against
NiCd's, since the NiCd's must be recharged at least every month.
Seems like $10 or so every couple years for a fresh alkaline would
be better than the hassle of recharging. Are the "9V" rectangulars
too big?

Hello everyone,

I will be calling CQ on 50.400 AM all this weekend.

Fri 9/26/97 16:00-22:00(PDT 23:00Z-05:00Z
Sat 9/27/97 07:00-22:00(PDT) 14:00Z-05:00Z
Sun 9/28/97 07:00-20:00(PDT) 14:00Z-03:00Z

I'll be calling CQ on the top and bottom of the hour.

Lets all get out on 50.400 AM and have some fun.
Solar conditions are favorable!

Equipment being used will be:

Gonset G-50 25w into ARX-6
Swan 250 40w into G5rv
Icom IC-726 into Marage A1015 150W into ARX6

If you have not seen my 50.400 AM page please check it out and let me
know what you think.

http://www.geocities.com/Hollywood/5860/50am.html

I think this will be a FUN weekend!!!!!
Everyone let me know how you all did and what equipment you used.

Thanks for your participation!

It's easy, oh brother of a flea. If there is a gap in the signal, invert the 0 to a 1 with a simple inverter. The empty spaces convey just as much information about the Morse signal as a dot or dash.

I really don't want to get into a bunch of crap about the merits or lack thereof regarding Samuel F.B. Morse and his code. As a CW guy since 1939 (age 13) I enjoy CW and I really don't give a damn about that controversy.

As a professional radio engineer I am also well informed about the relative merits and technology of the other modes, both analog and digital, so if you think I am some kind of stick in the mud, guess again.

I am just not interested in your vitriolic opinions on this subject.

Bill W0IYH

greetings

I don't know, the responces to my original message seemed to have
nothing to do with my message, so, I will try again.

I have been an amateur since the mid 60's. I have been involved in
most of the popular modes since they came into conception, eg 2 meter
fm early 70's, packet mid 80's, ssb 68ish, etc.
I am now trying to figure out where this hobby is going. I know that
spread spectrum is, more or less, just around the corner but I don't
think it will really arrive until the next decade.
Any ideas on what the next major new mode is going to be and where?

Source record: 90592

This is not correct. It is uncommon. On older computers one could tell the HD to move the heads to an extreme position that they would not be able to reach. This resulted in damage to the head positioning mechanism and/or the heads. This problem does not exist (as far as I know) on drives made since 1985 or so. On more modern computers one can tell the video card to change the video rates to some extreme value that most monitors cannot handle. The end result of this is either a fried monitor or damaged card. This setting would probably have to be left running for a while to accomplish this and it would be evident that something was occuring. I think it may be possible to screw up modern Plug and Play cards that use EEPROM by simply rewriting them repeatedly until the EEPROM fails. Haven't heard of this being done yet....

>Larry ve3fxq

What a wonderful question. Let's assume that your objective, although unstated, is to be ready for the next major change, whether it be a regulatory change, a new mode, or just newer technology to do the same old things.

Fortunately, the hobby of amateur radio, because of the CW mode, has been able to maintain some downward compatibility with a significant amount of boat-anchor hardware. In contrast, it is clear that narrow band FM and AM have bitten the dust. And thank goodness for that, because SSB is a far better mode than AM - both in terms of spectrum utilization and in terms of how many watts it takes to communicate reliably in a given frequency-time-path situation.

I think we have to assume that any new mode would have to offer to the majority of the active members of the community the same thing - i.e., a distinct improvement in efficiency in relation to cost while also providing a degree of downward compatibility with fundamental technology, such as CW.

Have you noticed that the antenna technology has not improved as much in the same time span? Granted there have been improvements - especially at the shorter wavelengths, but the antennas for 160 through 6 meters haven't changed that much in the last 50 or more years. I would be willing to bet that it will continue that way for several more decades. But those same 160 through 6 meter bands may fall into disuse, and that would make it irrelevant.

My crystal ball tells me that the amateur community will be talking more and more via satellite. The only question is, how do we finance it? The funding situation today is grim. Unless the amateur community can quickly agree on a way to develop and produce an entire infrastructure for satellite communication AND figure out how to collectively fund it, we will miss out on the opportunity of the century.

Hi Bill, I wasn't trying to embellish it. I was just trying to
understand
what you meant. Here's the rest of the quote:

Gary said: >> This
>> would represent a large improvement over conventional OOK Morse
>> signaling (because we could actually pack signals 2.33 Hz apart without
>> adjacent channel interference by using ideal matched filter detection,
>> something we can't do with Morse coding).

You said: >Not true.

I was just asking what part of Gary's statement that you said was not
true.
You could have been saying "Not true" about the method Gary was talking
about - that it was no improvement over conventional OOK Morse ...

BANDSPACE? Never heard of "bandspace". He must mean "bandwidth" which
also doesn't really apply to Internet. A better term might be
"information". Bandwidth refers to information per second, information
is just that, the total amount of whatever. However, there is no
correlation between information and intellegence.

>computer!!!!

There's no known way to cause physical damage to a computer by sending it a message/signal/packet/virus. (I suppose a lot of less-technical readers don't realize that -- there have been quite a few virus hoaxes over the years suggesting that a given virus could cause physical damage..)

>'Attack' means to use hacking techniques, UDP specialized commands
>sent via the network, polling-any low thruput command sent via the
>network that causes the target computer to take time to process it,
>and that DOESN'T genearate a reply meets this criteria.

Just be aware this could be technically illegal in some jurisdictions. In some ways, it should be -- what happens if one of the spammers decides something *you're* doing is wrong & decides to attack qsl.net? On the other hand, if someone does attack a spammer, I'm sure not going to have any sympathy for the victim!

greetings
I have been an amateur since the mid 60's. I have been involved in most of the popular modes since they came into conception, eg 2 meter fm early 70's, packet mid 80's, ssb 68ish, etc.
I am now trying to figure out where this hobby is going. I know that spread spectrum is, more or less, just around the corner but I don't think it will really arrive until the next decade.
Any ideas on what the next major new mode is going to be and where?

A good idea. Hopefully they'll go along - I personally would find
such an article interesting reading.

>I, for one, would never patronize an ISP who propagated spam.

I read an (unconfirmed) report that one of the best-known spammers was
about to get kicked off their current ISP. They had a tentative
contract with another ISP, but the clients of that ISP got word of
what was happening. When several dozen said "he goes, or I do", the
deal fell through.. IOW, you're not alone<g>.

Even if you don't believe Carl's question was serious, I would like
a better explanation. You can't invert the 0 if it doesn't _look_
like a 0 due to noise. What if a long 0 gets truncated by noise?

A lot of people (me included) have had good results placing ferrites
(not necessarily a balun) at the feedpoint, and optionally at the radio.
I use "Line Isolators", from Radio Works and they've been very effective
at reducing RF in the shack, and also feedline noise pickup.

You might want to add a series diode with the current limiting resistor so
the power supply does not get fried from reverse voltage if it is turned off
or your power goes out.

Logic circuit designers do this all the time. Anything below a certain level is a 0. If you invert it, it becomes a 1. Anything above a certain level is a 1. The trick is to define the optimal thresholds for 0 and 1.

In logic pc boards there is all kinds of junk close to ground level that has to be ignored. In radio on-off keying the junk level is sometimes pretty high and the identification of 0 and 1 can be difficult. This is one of the basic limitations of on-off keying, including but not limited to Morse code.

In Morse, distinguishing a dot from a dash can sometimes be difficult. One thing that helps a great deal is the difference between a musical tone sound and a noise sound. The operator is good at making this distinction.

If the signal to noise ratio is a few dB the process works OK. Highly skilled CW operators are good at doing this mentally. They also know how to operate their CW equipment in a manner that helps to get the job done. In other words, personal operating skill is a factor.

Cecil, In initial tests of my 4:1 toroid balun, I did use a 200 ohm
resistive load. Unfortunately, I think this type balun is more tricky
than it looks, with the wire size, wire spacing, etc., all having an
effect on the final outcome. Maybe someday I'll sort everyting out and
try to fix it up. Thanks for the comments. 73, Bill N3WK

My (Carl's) question was QUITE serious ... your (Dennis') questions
above are astute, but they are just "the tip of the iceberg" ... Bill's in
DEEP (bullshit) here ...

> Logic circuit designers do this all the time. Anything below a certain
> level is a 0. If you invert it, it becomes a 1. Anything above a certain
> level is a 1. The trick is to define the optimal thresholds for 0 and 1.

(What a bunch of hand-waving and dodge ball ...)

I (dis)respectfully submit that you're full of crap ... you've already done
the demod (sliced out the bits) if you can tell that it's a 0 or a 1 ... thus,
you are still deciding on the basis of tone vs. no_tone (where no-tone
boils down to some undiscernable combination of noise/interference/fade,
so you haven't a clue and can't really infer shit from it, all you can do is
*guess* that the "dit" or "dah" tones weren't there ) ... where as FSK
sends BOTH tones, so there is mark energy vs space energy to compare
rather than simply tone vs. no_tone (which no_tone equates to "I don't have
a f___ing clue what that may have been")

Simply not sending the second tone (as in BFSK) results in a power
penalty and implementation loss for OOK vs. BFSK ... you can't
make a silk purse out of a sow's ear, no matter what your religious
beliefs ...

How does your mythical "matched filter/integrate and dump" receiver for
OOK Morse decide if it saw a 0 (noise in the interval between symbols)
or simply a 1 (tone) that had experienced a fade? How does it tell the
difference between a "dit" and a "dah" with a fade at each end???
Once again ... you're full of crap ... but I have to give you credit in one
respect ... like most rabid pro-coders, you are creative to the extreme
in conjuring up mythical scenarios that "support" and "justify" your
religious beliefs despite an overwhelming preponderance of facts to the
contrary ... (the "simply invert the 0 to a 1" part was really funny ...)

> In logic pc boards there is all kinds of junk close to ground level that
> has to be ignored. In radio on-off keying the junk level is sometimes

> pretty high and the identification of 0 and 1 can be difficult. This is
> one of the basic limitations of on-off keying, including but not limited
> to Morse code.

So you admit that you dismissed some very real limitations with
a faithful "wave of the hand" ???

The limitations/disadvantages of OOK relative to orthogonal signalling
such as BFSK not withstanding, you've dodged the fact that your
mythical "matched filter/integrate and dump" demodulator for OOK Morse
would be FAR more complex than an ideal demod for BFSK ... even if you
COULD solve the problem of the non-existent "space" energy without
incurring an additional implementation loss

In fact ... even if you keyed Morse as BFSK to avoid the power penalty
of not sending signal energy during the "space" intervals in Morse,
your receiver would STILL be FAR more complex due to the irregular
symbols ... facts are that regular codes (where symbols are all the same
length) are demonstrably superior to irregular codes ... and the receivers
remarkably simpler ...

> In Morse, distinguishing a dot from a dash can sometimes be difficult.

No shit ... we've been trying to tell you that OOK Morse is GROSSLY
sub-optimal for some time now ... but, despite the above admission of
difficulty, I somehow don't think you really comprehend the message yet.
(or are simply unwilling to accept the facts because they conflict with
your preconditioned religious beliefs that Morseodism is the "true religion")

> One thing that helps a great deal is the difference between a musical
> tone sound and a noise sound. The operator is good at making this
> distinction.
>
> If the signal to noise ratio is a few dB the process works OK. Highly
> skilled CW operators are good at doing this mentally. They also know how
> to operate their CW equipment in a manner that helps to get the job
> done. In other words, personal operating skill is a factor.

So now we're back to the "the brain is a magical processor that can do all"
mythology??? And "the operator's skill brings out the advantages or Morse"
(equally false crap ) ... it is undisputable fact that there are many digital
modes
that can perform flawlessly at far faster data rates than humans can do with
ear/hand OOK Morse at signal levels where the very best human OOK Morse
operator in the world would not even be able to detect the *presence* of a
signal, let alone copy it ... but you Morseodists simply refuse to acknowledge
such facts ...

Everyone has the right to their religious beliefs ... even folks such as you
Morseodists who believe things that are demonstrably false ... such cults
even have the absolute right to proselytize and "do missionary work" ...
however in the interests of simple honesty it would be nice if you were to
identify your religious propaganda as such in the future, rather than

attempting to bullshit unsuspecting, technically inastute potential converts
that it is "scientific fact" ...

Hi George, You should install a balun right at the feed point of the antenna. See the ARRL Antenna Book for plans for a W2DU choke balun made from ferrite sleeves. You should be able to get some at a hamfest. The ones about an inch long should be less than a dollar apiece. Get enough for a total length of about a foot, and make sure they're rated for 2 to 30 MHz. 73 es GL Bill N3WK

If anyone is playing with the new Atmel AVR 1200 microcontroller, I've written a simple Morse callsign ident generation program for it. I can email the source code to anyone who is interested. The AVR 1200 is *much* nicer (and cheaper) than the PICs that are usually used for this sort of thing.

For Sale

Ryan Communications SW1 transmitter board, factory built. For 40
meters. Works just fine. Xtal controlled, 1.25 watts @ 12 volts.
$10 + shipping.

Speedex Key, Black Wrinkle base on thin oak board. Nice condition.
This is a model without a shorting bar.
$25 + shipping.

Might trade. Looking for a frequency counter, older model fine,
80-100 Mhz or so....

Hi Bill, using a 200 ohm resistive load doesn't accomplish anything because the chances of the balun seeing 200 ohms looking up a 450 ohm ladder-line into a non-resonant antenna are infinitesimal. Even if it worked perfectly with a 200 ohm load, it still would not work well in a high SWR situation. The only time the balun would actually see 200 ohms is if the SWR on the 450 ohm ladder-line was 2.25/1 AND one fed the system at a current maximum point on the ladder-line.

Hi Bob, what you say is true. But since 13.8v doesn't give a full charge, knocking off another half volt charges it less. I prefer to just keep an eye on the charging process to avoid the problems you mentioned. Another solution would be to crank the voltage up to 14.3v and use a diode.

Attention fellow amateurs:
The KB0YKI Antenna's, Ham Radio and more page has added another section. The newly formed Northeast Missouri Amateur Builders's Association page is now in operation. In order to join the group, simply send by email or snail mail a design or idea for an antenna, tower, or other radio related item you have built or would like others to look at.
Also I have a set of plans for yagis, J poles, Super J Pole, quads, and Collinears. Take a peek and see what you think. Also included are online designers for quads and yagis. Design your own while you are online. 73 and happy building.

>
> Bill W0IYH

Please, please, please elaborate on this one, oh sage of wisdom ...
How does one do an "integrate and dump matched filter" for the
(nonexistent)
energy of "the spaces-in-between elements" ???
(hint ... all that exists there is noise and/or interference)

Besides ... the Morseodists all claim that one of the major
advantages of OOK Morse is that "it's the simplest to implement"
(always neglecting the fact that FSK would be at least as simple,
if not simpler in many ways ...)

Your "system" (were it implementable at all) would require at least
5 different types of matched filters (assuming you can describe how
to do an I&D on the problematic non-existent energy during the spaces
between code elements in OOK Morse) ... actually, there would be
"dit," "dah," "element_space," "character_space," and "word_space" ...
three of which contain no signal-related energy at all with which to
operate, therefore, you still have to explain how one does correlation
and/or an integrate and dump matched filter against this absence of
any signal-related energy???

BFSK would require only 2 matched filter types ... and provides energy to
correlate against for both "mark" and "space" tones ... as Gary has pointed
out, this presents distinct advantages relative to OOK Morse ...

I'm hoping someone can help me out here. I was able to get a bunch of batteries from a old
telephone voice mail system.

They are configured in what looks like a six pack of beer (:)). Each cell has the following label on them,
2v 25ah(Lead Acid) each which of course when to you place them in the 6 pack gives you about 12v.
I have about 11 of these 6 packs. I haven't used them and I want to build a charger or something that
will maintain the charge up.

I would like to get some feed back from anyone with circuit ideas.

I also have 2 panisonic 12 35ah batteries as well both have no charge in them they read 0volts. Anyway
I can bring them back to life??

Please post and reply via the e-mail Thanks.

Greetings,

Really like my Knwd ts850, but it only provides for a single antenna.

Can anyone help me out with VERY DETAILED plans for adding an add'l antenna that can be used for receive only?

Want to get on the lower bands, have room for TX antenna, but will have to use separate antenna for receive, such as a small magnetic loop ... hence my need for add'l antenna for the 850.

Appreciate any replys, but please be very specific ... not an engineer ... sales and marketing guy!

Thanks,
Craig, AA3MD

The future of radio?
I'm interested in these PC bus card radios that use the computer as the front end. This allows the computer to replace not just the front end, but an entire desk of test equipment, all of it running simultaneously in different windows. It would be a quantum leap for teaching RF theory.

The card itself will become cheaper and cheaper as MMIC and DSP technology improve. In fact, once parallel instruction DSP chips can be driven at the speeds CPUs are currently driven at, a single chip will be able to detect, mix, decode, encode, filter, etc.

Then there's the antenna/feed coax/balancer stages. LOTS of room for innovation there. How about a computer controlled, _active_ feed line that would eliminate the need for a balancer? How about a truely cheap az-el system and multiband antennas?

Just as a WAG, I'd say it sounds like it may be some sort of transient
suppressor or part of an EMI/RFI filter ... I'm betting the 3rd lead goes
to ground, right?

> My TV's symptom is that there is no sound and no picture. I traced the
> power all the way to this component. This component is very hot to the
> touch.

That's a bad sign ... sounds like something inside has broken down
and can no longer withstand the line voltage ... or something downstream
(deeper inside the TV, from the perspective of starting at the ac line cord)
has died and is drawing excessive current *through* the part that is getting
hot ...

> But it's enclosed in a plastic case and there is no heat sink
> attached to it. So I think this component may be the culprit.

I think that's a good guess ...

> If anyone can help me with any info on where I can get the schematic for my
> TV, or where can I get the replacement component, or help me identify what
> it is, I'll appreciate greatly. Thanks in advance.

Have you tried the local Sony service place??? Often high volume consumer
electronics products have proprietary parts in them, with numbers that are hard
to (or impossible to) find outside ...

In any event, this sounds like it could be a fire looking for a place to happen
..
I would recommend you not leave this thing plugged in without direct and
continual supervision ...

## 3060. Paralleled power supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-28 00:00:00 UTC
From: "Ian White, G3SEK" <G3SEK@ifwtech.demon.co.uk>
Message-ID: <aFHFLDA6BZL0EwDa@ifwtech.demon.co.uk>
Source record: 90534

Is it possible to connect two regulated power supplies in parallel to increase the output current capability? Somebody asked me the question, but they don't want to sacrifice two good power supplies to find out :-)

Both units have an external "+sense" input which is normally linked to the + output, so I'd thought about adding a series diode to each unit, joining them together to make a combined output, and then connecting the sense inputs of both supplies to a permanent load resistor across the combined output. With careful adjustment of the voltages this should ensure reasonable current sharing.

Does anybody know from experience if this will work?

(Both units are switch-mode, if that matters.)

Those sound like a pack I bought at Dayton a few years ago. Mine were Gates "Cyclon" batteries, which use a starved-electrolyte system. They're very nice batteries. IF this is what they are (and they should say so), Gates recommends constant-voltage charging at 2.4 - 2.6 volts/cell for cyclic use, or 2.3 - 2.4 volts/cell for float use. There is no limitation on maximum current from the charger. If you let the cells discharge to a level below about 1.85 volts/cell open circuit, the battery may be permanently damaged. They self-discharge very slowly so if they're not used you shouldn't have to top them up more than once or twice a year unless stored where it's very hot. NOTE that if this is NOT the kind of cells you have, the above conditions don't apply. Most other lead-acid batteries have a maximum charge current specification, and the charge voltages may be different.

RF Parts has them for $37.50 and Antique Electronics for $44.50. All you
Boat Anchor guys out there get busy.

My Boat Anchor is an HQ129X (1945) that I have modernized pretty much.

Now wait a second here. Are you saying _I'm_ one of those people, W0IYH?
_I_ don't beat up on people _or_ keyboards. And I don't see anyone else
in this conversation right now.

I ask you, again, to explain your 5 filter system for cw.

Interesting logic. But I doubt that the schematic has been drawn to
intentionally obfuscate.

If you were to obtain the service manual for this rig, and if is done as
well as the IC-781 manual is for instance, you would find a clear
exposition which covers many "sectionalized" schematics which may take
some time to understand, but not because somebody is trying to pull the
wool over your eyes. Its quite too complicated for one small schematic
to give you a clear picture.

I have a six-footer that I no longer use that I'd be willing to part with for $25.00, and I could even probably take it to you (I have a pickup). I believe I still even have all of the mounting hardware for a roof-mounted pipe mount, but I'm not absolutely sure. It was originally used as an SCPC audio receiver, and I believe it's made by Prodelin. I also have a 4 GHz feed and LNA I'll throw in. Let me know if you're interested. It's presently in my backyard in Newark.

Those were tough enough 10 years ago!!!

"William E. Sabin" <sabinw@crpl.cedar-rapids.lib.ia.us> wrote:

> You don't make a receiver better by
>throwing more tubes into it.

Bingo. The more tubes, the more noise,the tougher
it is to align. The idea is to get the max gain
and lowest noise out of the fewest stages.
One of the nicest things about tubes is that they
tend to force people to choose the simplest designs.

>With vacuum tubes, more is not better. With RF integrated circuits the
>exact same thing is true.

I am a tube salesperson, so I cannot comment knowledgebly
re RF IC's.
I will say that the *good* ham & SW gear that was made
back in the old days involved a considerable handwiring
(uggh, check out some Hallicrafters' bandswitches, yikes!),
and could not be duplicated these days for less than
6X to 10X the price. Them ol' National HRO's sold
for $359 new in 1951!

BTW, we have a good deal on Russian 807's
if anyone's interested. Check out:

A sure sign/advantage of a workhorse device is ubiquitous availability.
So, check several sources for parts (JDR, Mouser, Digikey, All
Electronics, Newark, Allied, etc.) and find those transistors with
characteristics you are interested in such that they appear in as close
to all catalogs as possible.

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

AW, poor Bill ... he can't stand being caught not knowing what
the hell he's talking about ...

I seem to recall him bragging about having been involved in
writing sections of "The Radio Amateur's Handbook" ... that
would tend to explain why it's so backward and has omissions
and errors ...

YOU "go fly a kite" Bill ... *you* do the amateur community
a disservice by spreading falsehoods and inaccuracies in
support of religious dogma relative to Morse ...

You're certainly entitled to hold your religious beliefs WRT
Morse's mythical "superiority," but when you confuse and
mis-educate folks by spouting it as "fact" them others have
a right to "call you out on it" ... if you are not prepared to
handle that, that sounds like you've got a personal(ity) problem
to me ...

Perhaps you're referring to an article by Meyer titled "Accurate Single-Layer Solenoid Inductance Calculations" in the Technical Correspondence section, April 1992 QST, page 76. Corrections appeared in the July 1992 QST on page 73. The calculations get a bit involved. At the time of the QST article, there was a BASIC program available on many ham BBSs called IND.EXE which would perform the calculations for you. I use a program by Brian Beezley called COIL.EXE, which calculates inductance and Q, taking into account wire conductivity as well as losses for several types of coil form materials. A demo version of COIL.EXE used to be available for downloading; registration was only 10 dollars. I believe this program is included in the software package that comes with the newer editions of the ARRL Handbook.

Regards

Lyle

That's nice ... I knew you were only referring to me, Bill ...

BTW ... I'm *still waiting* for your explanation of how you
are going to build "integrate and dump matched filters" for the
non-existent signal energy in the gaps in OOK Morse ... and
please don't give us your "simply invert the 0s to 1s" garbage
again ... that turkey don't fly ...

Also, after you've explained how to make that work (which
should be shortly after Hell freezes over), please explain
(in detail) what would be the advantage of building a far more
complex receiver for an irregular code, when a regular code
will ALWAYS give superior performance???

"Carl R. Stevenson" <wa6vse@fast.net>
shared these priceless pearls of wisdom:

->Mark J Sandford <sandford@tridsys.com> wrote in article
-><342851B8.51459E9D@tridsys.com>...
->> Is it possible to build a crystal filter with overtone crystals
->> operating in overtone if so how are the crystals made to operate within
->> the filter in the overtone vs. fundemental mode????

It is possible, but it is a royal pain in the ass. The circuit passive components (Ls and Cs) turn out to be so horrendous with overtone parameters that it rapidly becomes a problem more of passives than of the crystal itself.

HOWEVER, having said this, one of my contacts at Jan Crystal in Florida tells me that they are making production quantities of any fundamental rock up to 100 MHz.+ Making the filter from VHF fundamental rocks is a hell of a lot easier than trying to use overtones. If you have trouble finding the right person at Jan, email me and I'll give you the engineer's name.

AFAIK, the FCC no longer issues Class D FM Broadcast licenses (10 watt
educational FM stations). It's all Class A and above now.

It's not a simple process where you fill out an application, send in a
fee, and buy the equipment off the shelf. It's a complex process that
can take several years to accomplish. You have to apply for the
license, have a comprehensive engineering study done to ensure your
station will not cause interference with ANYBODY, get a construction
permit (when you get the initial OK from the FCC), buy the equipment --
transmitter, antenna, feedline, studio-transmitter link, transmitter
site, Optimod, studio equipment, EBS system, transmitter remote control,
have another engineering study to make sure it all falls within FCC
guidelines, and get the final nod for the operating license. Don't
forget that you also need a Chief Engineer (in your case, a part-time
employee is OK) under some sort of contract and retainer fee to keep
everything running smoothly. We're talking big bucks ($50,000 to
$100,000 neighborhood for a basic set-up) to get up and running.

I couldn't tell you where to start looking for grants. Lots of
research.

> PS Also, what is needed to pass the FCC tech test(age requirements, degrees)?

You just need to pass the FCC Radiotelephone Operator's License test
(what the Chief Engineer must possess). There are no age or educational
requirements.

On air operators (DJ's who run the controls) must have a Restricted
Radiotelephone Operator's Permit (fill out the application and send in
$35) which basically says that you are trained and know how to operate
the transmitter and EBS equipment.

One local high school here could no longer afford to maintain their
station and they shut themselves down. It's expensive to maintain.

Don't even attempt to homebrew an FM station. Fines for running an unauthorized broadcast station are pretty stiff ($20,000 and up).

Hope this helps. I'm not trying to scare you away from building a station. It's a great thing to have. I'm just letting you know what's involved.

# 3093. IF Notch Filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-29 00:00:00 UTC
From: Stewart Baker <baker@nildram.co.uk>
Message-ID: <27223560897517ntc@nildram.co.uk>
Source record: 90470
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have a much modified TS180s and wish to fit a notch filter at the IF.
The audio one I have works well, but strong signals capture the AGC.

I have not found any designs in all the books and mags I have.

The TS180s IF is 8MHz and I will convert this down to 455 or 100kHz. and
do the notch there.

Anyone with ideas/circuits or how it is done on a commercial rig.

Many thanks

Stewart G3RXQ

The "spaces in-between"?? How can you have a matched filter for the
absence of a signal? The integral of zero is zero. Further, since the
"dot" signal is a proper sub-set of the "dash", exactly when do you "dump"?

In reality, there is only a "dot" filter, and you have to make a more or
less arbitrary choice as to whether there is a signal present or not.
Which is why OOK (be it fixed-width or Morse) is far from optimal.

As others have said use diodes to be sure that no reverse current
can destroy one of the supplies.

Allso if the supplies have Max current limiters go ahead and parallel
them as the worst that can happen is one will go to max outpiut and
the other will pick up the remainder of the current.

> Which is why OOK (be it fixed-width or Morse) is far from optimal.

In the first place, I never said that Morse code is "optimal" in any sense. I would appreciate it if you would not ascribe things to me that I have never stated.

There are 5 intervals in Mores code:

1) The dot interval
2) The dash interval
3) The interval between dots and dashes
4) The interval between words
5) The interval between sentences.

In any on-off keying system, we make the following decisions:

1) Is the signal present?
2) Is the signal absent?

In any on-off type signal we assign a threshold level. Above the threshold the signal is presumed to be present. Below the threshold level the signal is presumed to be not present. Digital logic does exactly this all the time.

If the signal is absent the threshold detector can be followed by an inverter that converts a "low" state to a "high" state. This high state can be integrated or timed so that the duration of the "signal absent" interval can be determined.

In Morse code there are 3 "signal not present" intervals. As part of the Morse code translation by a computer we would like to be able to identify these three intervals. They contain valuable information about the Morse signal, especially when it is transmitted from a computer.

We can do this by assigning a matched filter for each of these three intervals (after the logic inversion that I mentioned). These three filters, combined with the dot and dash filters, can then be sorted out

by the computer and decoded, character by character (using a lookup table), word by word and sentence by sentence.

As I have said previously, a major problem is deciding the threshold level that we use to decide "signal present" and "signal not present". It depends on the signal to noise ratio. Computer algorithms are possible that calculate an optimum value for this threshold "on the fly".

Also, the receiver design must be optimized for weak-signal Morse reception. One thing that we can take advantage of is the difference in the spectrum of a single frequency tone in the "signal present" state and the noise that lies in the "signal not present" state. DSP, combined with adaptive filtering and correlation techniques can be used for this. For example, suppose we adjust the receiver for a 500 Hz tone. A special correlator algorithm is then an excellent filter for that 500 Hz tone.

These kinds of methods can greatly *improve* the machine-decoding of Morse code, and I am certain that some of this has been done, but I don't have any references available.

Finally, I want to make a few things clear so that I will not continue to be misquoted, misunderstood and subjected to diatribe:

1) Morse code is not, from a purely technical standpoint an optimal signalling method. On-off keying has a basic limitation regarding the signal to noise ratio and the determination of the threshold level. Also, the determination of the "dot" or "dash" and the three space intervals presents further problems.

2) Nevertheless, I believe that CW operation is a valuable asset for Amateur Radio operations. There is more involved than purely technical merit. These factors involve the following:

a) The long historical interest in CW. This is not the same as stick-in-the-mud refusal to accept change. That kind of diatribe belongs in the garbage can. There are a lot of hams who genuinely like CW, and I think that they have legitimate right also. These people pride themselves on the CW skills that they have acquired through long practice. I don't think that they (I include myself) want the opinions of some highly vocal opposition group shoved down their throats.

b) It is a fact that CW, under weak signal conditions, can get through where others fail. There are two reasons for this. The xmit and rcv bandwidths are narrow, which *reduces* adjacent channel interference. Also, Shannon's equation supports the idea of a very slow message that is sent in a very narrow bandwidth. The SETI folks know all about this idea.

c) There are a lot of low-budget, low-tech QRP types world-wide who want to get started in Amateur Radio with simple gear that they put together. CW is an ideal vehicle for this.

d) Regarding the testing of Morse for licensing: I think it should be retained in some minimal sense, say 5 wpm. Reason: it makes sense for Amateur Radio, for the reasons that I have mentioned. The reason the military has eliminated it is *partly* because of the time and cost of training operators that can copy 25 wpm on a typewriter with no errors. When the person finishes his/her "hitch" they have to do it all over again to a new group. The other reasons are technological and I have no arguments about any of that. It is certainly simpler for an operator to bang the keyboard, then push a button that puts a completely error-free message through.

e) Aside from all of that, I certainly believe that Amateurs should become involved in the more advanced technologies. I am certain that there are many operators who operate data modes and SSB and also enjoy operating CW. Why CW? Because they want to! Isn't that reaon enough? And they don't need to be belittled or bullied for it.

>The ultimate boatanchor receiver...

I believe I may have *seen* one, but I've never attempted
to *lift* one. The only National I've owned was the NC-190
drift-O-matic. That thing was a horror. I replaced it with a
Drake 1A, and later with a Drake 2B. Now that was a neat
*little* receiver (though Drake wouldn't have recognized it
after I got done modifying it).

I heard that MTBF was very poor on the monster you're
talking about, something on the order of 150 hours as I recall.
I think it drew nearly half a kW too, maybe more, that was a
long time ago. That's quite a contrast to a modern HF receiver
(or even transceiver). Receive draw is on the order of 12 to 25
watts, and MTBF is on the order of 20,000 hours (after infant
mortality). Some are even more thrifty.

I suppose those old monsters have a certain charm, like an
old steam locomotive, but I'm just as glad we have things
that work better now. I will admit to still owning a B&W 6100
though. That was the first amateur synthesized (crystalplexed)
SSB transmitter, and the first store-bought radio I ever had..

I used it on RTTY up until about 15 years ago when I got talked
out of the 2B by a neophyte wanting a receiver for code practice
and broke up the station. (I had upgraded to a used pair of Drake
Twins for my voice rig, but they couldn't handle the guff of the long
keydown times of RTTY, sissy sweep tube finals.) I tried to give away

the Mod 15, but no one would take it, so it wound up as landfill.

The B&W needs new filter capacitors now, and I might get around
to putting some in someday. It is rather impressive, in an early 60s sort
of way, but I doubt I'll ever put it back on the air. My now almost ancient
IC-735 does yeoman duty for my HF digital operations today. That thing
is a rock, it just won't quit.

# 3105. Tube substitution in Swan finals

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-29 00:00:00 UTC
From: kmccoy@stetson.edu
Message-ID: <60mur3$l68$1@beret.stetson.edu>
Source record: 90482
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Pardon the cross-posting. I am having some trouble while transmitting on my vintage Swan 400 (all tube). It seems to arc once the tubes in transmit circuit heat up; the lack of visual evidence around sockets and solid state components leads me to believe it is in a tube somewhere. I have tested and replaced all tubes except the finals, since the setting instructions are confusing to me, calling for an external ampmeter to further adjust the bias to 55 ma (even though the adjustment knob only goes to 50 ma)...

Anyway, the real reason for my post is that the tubes currently in the final amplifier stage are 6146. The schematics and manual call for 6HF5. The compatibility of these separate types is unknown to me; the settings on my Heathkit TT1 tube tester differ greatly.

Does anyone know whether these tube types are compatible, or should I consider trying to acquire the original tube type called for in the manual? I don't *think* there has been any modification to the circuitry.

Please reply here or email me directly at kmccoy@stetson.edu

Thanks much,

Ken KF4BQF

No antenna works properly when masked by metal. But any vertical mounted on your roof can take advantage of the metal and use it as a groundplane. So you want the antenna on the roof in full view of the world. This conflicts with your desire to have a hidden antenna, but there's a way out of this. That's to make the antenna *look like something else*.

Ok, how do we do that? Well first lets ask ourselves, what do we normally see on a roof? One of the things we are likely to see is a *vent pipe*. These are normally PVC pipe today. So there is your solution. Put an ordinary 2m antenna inside a piece of PVC and put it on the roof. It looks like a vent pipe, and your neighbors will think that it *is* a vent pipe and not an antenna.

So how do you mount it, and what do you do with the coax? The best way to mount it is to slip it over a *real* vent pipe. And run the coax down *inside* the vent pipe. There's a company which can supply this sort of antenna to you ready made, the antenna is called a Ventenna. Or you can use a bit of ingenuity and make your own.

Now a 54 inch pipe to hold a J-pole is probably a bit much, but a 19 inch pipe to hold an ordinary quarterwave worked against the metal roof as a groundplane, is just about right. It won't look out of place at all. If for some reason you can't slip this over a real vent, you can use a magmount quarterwave contained in the PVC pipe and just stick it on the roof. You'll have to do a bit of camouflaging of the coax, but RG-58 can be hidden with a bead of caulk.

Hi...

Anyone have schematics for WE-sat 137MHz APT homebrew receiver?

Tks.

I know this kit is no longer produced but I was wondering if anyone had
a copy of the schematics and parts list available? I have the kit (i
had forgot that I had it) and would like to assemble it but need the
schematic,parts list and tuning instructions. I would be willing
to pay any copying costs.

Anyone have a glossary with APT in it? I see it here all the time, but can't find a definition anywhere.

Sorry! A slip of the mouse.MAGNETIC SURVEY INSTRUMENTATION

Prices include shipping in Lower 48.

MEDA uMAG-02WB Handheld, battery-operated digital
fluxgate magnetometer. Sensitivity: +/- 0 - 20.00 - 200.0 -
2000 milliGauss F/S, DC-400 Hz (-3dB @ 400 Hz ref to DC).
Analog output +/- 2.000 V F/S. Linearity .02% or better.
Absolute accuracy +/- 0.5% or better, traceable to NIST.
With 10 meter cable and transverse probe, 6 spare batteries
in storage case, multiple-battery harness for up to 8
batteries (approximately 12 days continuous operation),
analog output cable w/BNC (to oscilloscope input), manual,
calibration certificate, transit case. In new condition.
Current price from manufacturer is $900. Sell at $450.
Three available: all three, $1300 including 3-channel
chart recorder (see below).

LEEDS & NORTHRUP SERVO RECORDER 136-304-304-304-00-00-00-
L0088-L0088-L0088-6-BV-000. Three-channel servo recorder,
modified for potential inputs. Can be internally adjusted
from +/- 1 millivolt F/S to +/- 2V F/S. Set at +/- 1V F/S.
Chart speed @ 60 Hz 2cm/hr or 2 cm/minute (at 50 Hz = 1.67
cm/min or 1.67 cm/hr). Internal line voltage selection for
100/120 V, 220 V or 240 V. Power burden: 27 VA. Power input;
3-wire IEC connector. (Uses standard IEC cords). With 2 sets
spare pens, 2 boxes charts, NEMA line cord, a few spare parts,
carrying case; Used, good condition; $100.

# 3112. help: unidirectional antenna needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-29 00:00:00 UTC
From: "Randie Ohtsji [4555]" <rohtsji@glenayre.com>

Hello,

Does anybody out there know a good unidirection antenna design for
transmission purposes (as opposed to receive). I basically
need to transmit in front of me, none to the rear and very litte
to the sides. Is there also some way to vary the angle of how
much is transmitted to the sides? I need to transmit a 433MHz
signal into a 50 ohm unidirectional antenna.

Any help/suggestions/comments would be appreciated.

Thanks in advance!

-Randie Ohtsji

>

Cecil, Let me just say that I was experimenting with building and using a canned toroid design. If I had been successful with the 4:1 design, I would have tried a more-complicated 9:1 design. With either one, I still would have used an antenna tuner back at the shack to take care of any impedance mismatch. However, I gave up on the toroid balun because I did not consider such messy variables as wire diameter, wire spacing, insulation type, etc., that need to be included in the design process. The bottom line: toroid baluns are not worth the trouble. 73, Bill N3WK

## 3115. Adjusting for Signal to Noise Ratio ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-09-29 00:00:00 UTC
From: Anthony Levand <alevand@FoxValley.net>
Message-ID: <01bccd2a$d62b1740$50bae3cf@default>
Source record: 90492

I have a Yeasu 2 meter radio with a dual gate MOSFET rf amplifier. I can adjust the first tuned tranfomer for maximum gain, how would I find the optimum setting for best signal to noise ratio? I can see the signal and the noise riding on top in the osciloscope. Can I replace the mosfet with a gasfet for better sensitivity?

Tony, AA9CC

The modern way is to build an array of dipoles each including a digital
phase shifter. You then calculate and adjust each phase to get the beam you
want. And, by the way, you can place a very sharp null in the direction of
an interfering source that way.

The other way is to get a copy of the ARRL Antenna Book and pick a model
that suits your needs. You'll have to scale it from one of the ham bands.
That's the Amateur Radio Relay League.

You are probably going to wind up with a Yagi which is a buzzword you can
search on.

-> From the USA. The only socialist country that refuses to admit it. <-

Typically, this is handled by the use a a Yagi array. Check any
antenna book for details.

Unfortunately, there was an unplanned change of
IP numbers for the systems and the DNS entries
take time to propagate. You can get in to some
degree using the IP number as shown below.

Everything will be back to normal (except new IP
address) as soon as things get updated around the
world...

QSL/QTH.Net are up and healthy, just not as easy
to access as desired.

Looking for fully functional model with stand. Would prefer one with a 20ma current loop or RS-232, but I'll consider another interface. Unless you're real close to Spring, TX, I would probably need you to ship it as well. I know that's real pain for something this big, but I'm willing to pay shipping costs as well. It might be easiest to ship it in two pieces if that's possible. :)

Thanks,
Rich Armstrong

You may not know but Ramsey sells a 130 - 180mhz FM receiver kit. It should tune in the WeSat frequencies. The I-F may have to be widened. I may try that. They only cost about $35. By the way APT stands for "Automatic Picture Transmission" (I looked it up).

The none to the rear part means you need a parabolic or spherical
dish, or a large planar reflector behind the driven element. If you
can tolerate a small amount of signal to the rear, you could also
consider a yagi or a phased array. To vary the transmission angle,
you'll want to physically point the antenna. (You can do a degree
of beam steering by offseting the feed of a dish, but that level of
complication shouldn't be required unless you need a *lot* of
forward gain, and thus have a dish too large to mechanically orient.)

One of the ARRL books had plans for an 18 foot stressed parabolic
dish which should meet your requirements. You might also consider
an axial mode helix in front of a large screen reflector. Plans for that
are also in ARRL publications.

I use FT-902
I am not much convinced about the truth of what you refer to!
FT-news (borrowed from DK3UZ) shows many attempts to improve the lousy
notch filter for FT-901 (and FT-902). With the original s-meter
circuit one might have another feeling about the notchfilter, I use
MC3356 logarithmic s-meter circuit

(2N7006) I got 1000 items from a friend, used about 100. They seem
reliable - not damaged as easy as VN10KM and VN2222, problem/advantage
- as one sees it is the dil package, easy for dead-bug mounting.
VN10KM will work ufb for 80m QRP, while 2N7006 does not operate on HF
or in quasi linear mode at all, nor does BUZ11.

>Bill W0IYH

You don't need 5dB NF on HF, but somewhere in the region of 8-10dB on
10m, on the other bands it is less critical.
Drake 2-B works satisfactorily while not every R-4C are good. Some
have a noisy third mixer.....
3dB noise figure is possible on 2m with low cost valves like E88CC,
E189CC. We believed transistors were so good, but often they worked
not as good as they could have done in our 2m gear.

I would be interesting if somebody cared to note all particularities
in design of old radio sets, some engineers may still exist. Many
clubs seems to care for keeping old radio's but just too often they
are more interested in polishing wood boxes than trying to understand
the technique behind it.

We learned that a popular valve portable receiver had some positive
feedback in the IF, an IF xfmr had an extra winding for this, but this
could not be seen on the circuit diagram. (Radionette Kurer).
I am sure engineers will be glad to tell us some gimmicks they had to
use to make the sets ready for production. Racal RA17 is another
receiver which would never have reached the production line without
certain gimmicks made by a hacksaw on chassis!

And just four years later, in 1969, we at National were building the MD-777/FRT, 2-30 Mhz synthesized, fully solid-state, motorized final tuning, Ledex switches on the front panel to allow for remote control of frequency selection, designed to work with transmitters up to (I think) 200KW, maybe 12 inches of 19" rack, don't remember the weight.

Right - I was always amused with how the hams in Cuba and Russia (and
a few other countries) used to put on their QSL card:

Transmitter - 40 watts (or 200 watts)

Receiver - 19 tubes

Like.... the QUANTITY of tubes they used somehow made it better???

Log periodics are also pretty good about rearward radiation with the
advantage that they only take up a lot of room in one plane.

Hi...

Well.. I had found a Very Low cost circuit at
ftp://ftp.esrac.ele.tue.nl/pub/ham/wefaxreceiver-kit
but don't work so well.. so I'm trying to get another one that simply works.

Tks.

6146 tubes require an entirely different socket than the 6HF5. If your
radio has 6146's, the sockets HAVE been changed and other changes would
have to have been made, possibly unsuccessfully since it is not working.
Sorry, this problem may be a tough one to solve.
Dick W0EX

I received the following in the e-mail today...

I am sure there are many on this newsgroup who grew up reading Doug's articles and books. I know I did and I owe a lot to him for helping me learn
a lot and to keep learning.

SB QST @ ARL $ARLB057
ARLB057 Doug DeMaw, W1FB, SK

ZCZC AG57
QST de W1AW
ARRL Bulletin 57 ARLB057
From ARRL Headquarters
Newington CT September 29, 1997
To all radio amateurs

SB QST ARL ARLB057
ARLB057 Doug DeMaw, W1FB, SK

Acclaimed ham radio icon Milton F. ''Doug'' DeMaw, W1FB, died September 28. He was 71. One of the most widely published technical writers in Amateur Radio, DeMaw was diagnosed with leukemia earlier this year and had been in failing health in recent weeks.

DeMaw was first licensed in 1950 as W8HHS. An electrical engineer, he was a member of the ARRL Headquarters staff for 18 years--from 1965 to 1983--and served as Technical Department Manager and Senior Technical Editor from 1970 to 1983. During his tenure at HQ, DeMaw served as editor of The ARRL Handbook. In 1970, he engineered the shift in emphasis toward solid-state design in QST and the Handbook. He has hundreds of articles in QST and other publications to his credit. DeMaw also was founder and publisher of VHFer Magazine. (His wife, Jean, W1CKK, also worked on the Headquarters staff.) DeMaw was a life member of the ARRL and a senior member of the IEEE.

After retiring to the family farm in Luther, Michigan, he was elected chairman of the Lake County Board of Commissioners and continued to write books and articles. He also tried his hand in the Amateur Radio business as proprietor of Oak Hills Research. Among his other books, DeMaw wrote W1FB's Design Notebook, W1FB's QRP Notebook, W1FB's Antenna Notebook, and The ARRL Electronics Data Book, which remain popular. In recent years, DeMaw also penned a regular column for CQ magazine.

A former ARRL colleague, Membership Services Manager Chuck Hutchinson, K8CH, counted DeMaw among his friends. ''Doug loved to

experiment with circuits and antennas. He also loved to encourage others to try their hand at building,'' he recalled. Hutchinson said DeMaw not only wrote prolifically about ham radio but also about gardening, another of his avocations. ''He was an avid gardener and cook,'' he said. DeMaw also was an outdoorsman and hunter. ''He loved to hunt with bow and rifle--both modern and muzzle loader. He was very good at throwing a knife or hatchet,'' Hutchinson said. Paul Pagel, N1FB, also was one DeMaw's colleagues during his days at ARRL HQ. ''Amateur Radio benefited greatly from his work,'' Pagel said. ''He was a multifaceted man. I doubt there was anything he couldn't do if he set his mind to it.'' Jerry Hall, K1TD, who also worked with DeMaw during his years at HQ, called DeMaw a writer of ''uncanny'' ability. ''Doug could write it once, and it was done,'' he recalled.

Survivors include DeMaw's wife, Jean, and a son, David, N8HLE, a technical writer who lives in Connecticut.

you will need to use a vtvm and measure the noise with out carrier , then insert a carrier at about .2 to about 1 microvolt and measure where the "quieting " is 20 db below the noise level without carrier. a level of .3 uv for 20 db quieting is good......adjust the tuned circuits for the best quieting

>> Anyone with ideas/circuits or how it is done on a commercial rig.
>>

You can also do it by adding a single crystal at the IF frequency in shunt with the IF to ground. Tune it with a varicap and you can "move" the series resonant frequency through the passband. The old FT-901/902 series did that with 40-50 dB of notch available. Awfully good for the simplicity. Works best of course, at a point of relatively high feed impedance.

You are not clear on the concept. All antennas are bidirectional. If they
have high receive gain, they have high transmit gain.

> I basically
>need to transmit in front of me, none to the rear and very litte
>to the sides. Is there also some way to vary the angle of how
>much is transmitted to the sides? I need to transmit a 433MHz
>signal into a 50 ohm unidirectional antenna.

Try a Yagi. But any antenna Except perhaps a microwave dish) will have some
rear radiation. In the case of the Yagi, the rear is significantly less than
the front, but not totally absent.

Varying the "angle" means varying the antenna gain. I don't think so unless
you want to change its construction on the fly.

Bob.

Circuits Galore

Hi all, I'm back!!

Two weeks abstenance has meant little work on my homepages. I have replaced the counter to another that works. During the last two weeks the pages have had '0' visitors although 130 of those have sent me E-mail. Strange!!

PMS OTA
Just before the holiday, my old PC-jurassic blew itself to bits so my packet PMS, with all the radio, circuits is off the air but Ron, G0TLA, is still holding strong.

VALVE (tube) RX
The 'valve receiver' has seen a little more work done to it and the tracking across the lower MW band is much improved. With the new coil winding data the LO/RF tracking is almost perfect. Far better than expected.

OSCILLOSCOPE
Loads of comments about the basic oscilloscope information. The general opinion so-far is that it is not so basic, what do you think? Have I forgotten anything?

SYNTHESIZED RECEIVER
The ORIGINAL circuit diagram for the 'Synthesized Receiver' project was 100% accurate. The VCO and Phase Detector chips are NOT CMOS. Thanks to E-mail, I have now been spared the laborious task of taking my own synthesizer to bits to get the information for the homepage. I will now be updating the project hopefuly before Friday. Many thanks to the kind soul who took the 'time and trouble' to sort out my cryptic mess for me and provide the information.

REQUESTS
I have had requests for VHF and UHF RX preamps Not being so interested in VHF they will have to wait a couple of weeks, but it sounds like a good idea to me.

SOON
Coming soon is an AM TX for the MW band so that old vintage radios may again 'beat' to the rythm of Perry Como, or Dave Brubek.

DC RC HITS VLF
My Direct conversion RX was sucesfuly used on the VLF bands

from 15KHz upwards, I am awaiting a response from the gent concerned so that I may add the details to the homepage.

NOT AGAIN!!!
Finally if I get just one more request for circuit diagrams to locate lost model aircraft I will scream!!!! I the best method is to write your name, address, and telephone number on the wing. You could also offer an 'unspecified' reward for its return. Readers Digest are always giving away their 'valuable' pocket calendars, printed on genuine paper.

URLS
Ok then nothing else of interest to add so here is the URL, just in case you have not bookmarked the page. You will not be dissapointed.

http://user.tninet.se/~acz732k/ Main site
http://hem2.passagen.se/sm0vpo Mirror site

Have fun with radio Homebrew / QRP / Hamradio / Wireless.
Best regards from Harry, Upplands V�sby, Sweden.

PS Several E-mail massages have begun "I am not a licensed Radio Amateur, but ... ...". My page is not exclusively dedicated to HamRadio, QRP, but includes ALL aspects of homebrewing (including the booze - Hic!) and electronic construction.

I have heard that QST will be doing a review in the near future. They
are really impressed with the noval approach that this radio has.

I have seen 10.695 crystals used in many 10.7 IFs because they are
used in a transmit along with 10.240 to mix down 10.695 signal to
455khz.

YIKES!! No wonder you are having problems! The 6146 is a "real"
tranmitting tube, while the 6HF5 is a color television sweep tube. The
6146 was made to go all day and night without complaining at medium
power (about 180 watts CW input for a pair). Sweep tubes, however, are
great for *INTERMITTANT* service at high power. Doing a replacement
without circuit changes is really asking for trouble. The power supply
for the Swan probably delivers voltage too high for the 6146 and that is
causing the problem.

Get the tubes that are supposed to be in there. (I don't know offhand if
the tube pinouts are the same, so be real sure that no mods were made to
the set before replacing the tubes). BTW, they won't be cheap!

Mizuho DC-7X 40meter CW transceiver has an active component for direct conversion receiving. It is almost useless for night time in the US eastcoast because of the AM broadcasts.

I'd like to modify it to double-balalanced DC receiver. I have some idea how to
do it, but if anyone has done so, I would like to hear it before cutting the PC board.

That's interesting. QRZ says kc7zfp is Mike Abrams and he's been
licensed since 20 Sep 1997, just like he said...

I couldn't see how kc7zfp could have been licensed since 1994 since
I'm kc7lvv (an earlier call sign) and I've only been licensed since
1995.

[What? A flame war on rec.radio.amateur.homebrew? This will look cute on DejaNews in a year or two. Remember that when you're running for ARRL director]

Back to the original question... Perhaps you are looking at it. I will always love DX, but for technical discourse (excepting the original thread :) the internet seems to be superior to ham radio. I'd love to use my dual band handheld for talking tech stuff with local hams. Tried it. Dead silence. I have heard some good stuff on HF, but mainly relating to antennas and boatanchors. The times they have changed.

Rather than questions like which new mode will prevail, I'm more interested in issues like "How can we regain the spirit of comradery of the past?" I suppose that ham radio has degenerated like the rest of society. The lack of fraternity is the main reason I have lost interest in operating HF- and living in an apartment the secondary reason.

I'm at a loss for a solution also. I've tried to interest my nephew in radio and electronics, but he's only interested in computer games. Getting kids interested in science is not easy nowadays. Why would a kid be interested in radio when cellphones can communicate across the globe? or when they can use the internet? or when they can ask me why I don't use a radio to talk to hams, and instead use email or this NG

There is a site in Maryland that repairs Swans. They have government contracts that pay the bills and do the Swan stuff for giggles - really, I had them do some work and the prices were amazingly cheap!
There is a 40 Meter net at lunchtime weekdays where Swan affectionados gather to talk about such things and the guy who runs the Swan piece of that shop is often on. He's a real nice guy. Forget his call.
If you absolutely cannot find them let me know and I'll try to run the info down here somewhere.
Guaranteed they will restore it for real short money - and do a nice job of it. DavidC AA1FA

Find an RSGB handbook of late 1960s or 1970s vintage and look for
Peter Martin G3PDM's high performance receiver.

Single conversion, preselected, no RF amp, 7360 mixer, IF at 1.6 MHz(If
I remember rightly) with lattice crystal filters distributed down the IF
strip. Mixed thermionic and semiconductor design, and a phase-locked
summing loop for the local oscillator. I reprinted his very low drift
Vackar VFO in the ARRL handbook oscillators chapter, but the rest of
this receiver is well worth tracking down. Periodically, I wonder about
looking for a few 7360's and building one.

> A modern radio often has millions of active devices in it. That allows you

>

I understand your point, but I think that the logic works in both
directions.
Can it not also be argued that in some ancient thermionic radios, every
stage ran
quite high power, and so had a fairly high TOI simply because the only
available devices that worked at the necessary frequencies ran at those
power levels?

Simple receivers without frequency synthesisers or counters may
suffer in the frequency precision and stability stakes, but this can be
counterracted by the operator having to keep readjusting things. A weak
receiver that suffers overload effects cannot be similarly compensated
for its failings. Quantity of devices is not a complete substitute for
all performance parameters.

The classic structure with narrow, tracking RF selectivity, and
having the prime selectivity distributed down a multi-stage IF amplifier
is much closer to being optimised for dynamic range than the now more
usual block filter and block gain approach.

The designers of all the HF radios from the "Big 3" in Japan, have all assumed that distortion in the IF and AF stages after the main IF filter is unimportant, and so we have a few generations of radios which do not produce audio as clear as the HRO, AR88, and BRT400 of yesteryear. Conversely, there is the tendency of all of us to look back and remember things as being somewhat better than they really were, besides, things have also got a lot more congested than in the '60s.

Find the descriptions (by Pat Hawker, G3VA) of the work done by Colin Horrabin on high dynamic range receiver building blocks. With things like these SD5000 based mixers, the performance of the 7360 can be more than threatened. Medium power RF transistors in feedback configurations offer marvellously linear gain. The current limitation is the non-linearity of the actual quartz in crystal filters. None of these things are particularly recent. Rafuse's paper in the mid 1960s showed the use of DMOS devices in switching mixers, David Norton's patents on transformer feedback amplifiers have been around for some time. Peter Martin's receiver design was shockingly revolutionary at the time it appeared, but despite being overlooked by just about everyone (including me), it has sat there on many people's bookshelves, silently pointing the way to the architecture of very high performance receivers for the last 25+ years. I'm ashamed of how long it took me to realise what I'd overlooked.

Anyone with a kitchen table and a spirit of adventure can build a receiver that cannot be matched by anything they could buy, ancient or modern.

Cheers
David GM4ZNX

Quicker ...

Type "yagi design" into alta vista..
There are about 5 pages out there that show you how to build yagis.
The Antenna Elmer page has a nice little 3-element you can make out of
1/4 inch conduit

Hi--

The "workhorses" I like to use are the 2N5486 for RF (similar to the MPF-102 only better specs), and the 2N7000 for low-power switching (under 1A). Both are cheap and easy to get, and both are available in through-hole or SMD.

I guess I'm disturbed the most by how people have grown so accustomed to mediocrity in everything they buy.

If you pay $3000 to $5000 for anything like a radio, you should expect to get a service manual. After all, we are hams. But then again, maybe the Japanese are making an accurate estimate of the technical abilities of the average modern ham.

For anyone who can help, I am looking for a schematic for the Rohde and Schwartz
EK07 tube receiver, which despite using all tubes, achieved a very high third order intercept.

I spent quite a bit of time with my R4-C, experimenting with tubes and various mixer and RF amp circuits, and have not been able to boost the IMD performance, with one exception- bypassing the RF amp. In that case you get 10db higher dynamic range, but inadequate sensitivity on 20M and up. So I'm interested in seeing what Rohde and Schwartz were doing to get such high performance.
(I tried the Rohde and Schwartz web site and their posted email addresses are not valid)

Lastly, on tube designs- the old color TV's from the late 60's and early 70's are still, I believe, some of the most elegant circuit designs ever made. With 10-20 tubes their picture is no worse than the modern set using millions of transistors.

If you can figure out how to make them appx 1/3 of the length they are
now, change the feed loops to 1/3 amd make the interconnecting cables
1/3 then there you go. Sorta in the ballpark. That's why 1.2g cans are
tiny. Seriously you would be better off buying some and selling the
450's.

>
>

Very nice obsolescent device. Nice because the stud is isolated from the collector.

28 volt NPN 400 MHz device
Vceo 40 volts
Vcb 65 volts
Ic 1.5 amperes

I use it as an amplifier for my 2 tone test gear for intermod tests at 14 MHz, just because of the stud isolation. (EVERYTHING is quadruple shielded and that helps) At that frequency, I get 19 dB of gain. At 100 MHz, minimum gain is rated at 8.5 dB.

Holding it face to you, with the center pin on top, collector is to the right, emitter to left, and the one on top is the base.

As for your observation to the "modern"electronic junk that is floating out there you are RIGHT
on the fact that the late 60 and early 70's TV recevers are some of the best out there. I have a
RCA New Vista Color 23" recever in the entertainment system that uses mostly tubes. The only
transister that I can find in there is the UHF tuner mixer and osc. That thing looks BETTER than
my later model Sony Trinitron! So much for fancy widgets! I have to say that I like tubes better
(lets try a PENTIUM with a pile of 12AX7's) than transisters. As for my radios....Philco 48-1264
fully restored and the RCA with a NEW picture tube!
Keep'em glowing! 73's to the group

Connect it to a circuit analyzer and have look were the notches are at around 1.3 GHz :-).

Usually at 450 MHz the cavity is a 1/4 wavelength resonator, however, it will also have resonances at 3/4, 5/4 etc. wavelengths. The resonances are not at exactly 3 or 5 times the fundamental frequency due to the tunning capacitance, so there are great chances that the 3rd harmonic is near the frequency you want.

Looking at a Sinclabs data sheet, they have two duplexers with identical external dimensions, the one for 445 MHz (SD445-4) is 1/4 wavelength and the one for 1270 MHz (SD1270-4) is three quarter wavelengths. As 3/4 wavelength resonators are used in commercial designs, I guess that you might have some success with your Wacom 450 MHz duplexer.

## 3203. Telemetry Node???

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-02 00:00:00 UTC
From: Ted Maczulat <tmacz@arrowsmith.net>
Message-ID: <60vf6b$h2f$1@cameron.arrowsmith.net>
Source record: 90377

Hi and thanks for reading this.

I am looking for a telemetry node. Kantronics used to make one.

It is a normal TNC running network firmware. It also has 8 analog
inputs to measure stuff at the site.

I also have hears that someone was working on a kit for a standard
TAPR2 tnc that would add telemetry measuring capability.

Kantronics' new tnc have A/D conversion built in but for only
2 analog channels.

I need this to track conditions and power supply state at our clubs
mountain top repeater site.

Thank you.

>
>I have an AD7008 DDS chip and have some questions for those who are in the
know.
>
>Is the output of this chip strong enough that you could hear it on a receiver
or does it need to be amplified?

The max output is one volt peak to peak, ought to be able to hear it in a very
poor receiver. The output level is adjustable with resistor from Fs to ground
(Pin 3) . Put a 50 ohm load on the output pin, (Along with a low pass
filter), and all the bypasses ought to be chips to keep the digital trash out
of the output.

Depending on what you want to do with it, all the pins from 7 to 18 can go to
ground except 16 and 17 which go to 5 volts. 18 thru 29 go to ground with the
exception of 27 and 28 which go to 5 volts. 31, 32 and 33 go to ground.

You ought to call Analog's Fax on demand service and dump their 7008 data sheet
if you haven't already got it.

800-446-6212

The fax code for the 7006 is 1240

## 3208. Vacuum Variable: UCSL-100?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-02 00:00:00 UTC
From: jmaass@freenet.columbus.oh.us
Message-ID: <6106uv$a00@login.freenet.columbus.oh.us>
Source record: 90382

I have obtained a motorized Jennings vacuum variable that appears to be labelled UCSL-100. My ancient (1968) Jennings catalog doesn't list a UCSL-100 (but does list the UCSL-250, UCSL-500, etc.).

The label on the capacitor leaves open the possibility that a digit might have been lost (i.e., perhaps UCSL-1000?), although I doubt it.

Does Jennings have a presence on the Web?

This device appears to be a 'pull' from military or commercial equipment. The vacuum appears to be intact, although one of the ceramic stand-offs is cracked. I haven't identified the control requirements yet, other than it has a 28V motor, much step-down gearing, and a DB-15 (or so: haven't counted the pins yet!) male connector all mounted on a brass base.

My plan is to use this to remotely-tune my 1nverted-L for 160M.

Any information welcomed!

I'm pretty sure that you have a UCSL-1000. In addition to being stenciled on the glass, it's etched in the berylium on the inside. Take a look for it. The one I think it is was used in several military antenna tuners, the one with the big gear reduction and the limit switches was an RCA tuner, the one with the fork that was gear driven vertically and pulled a piece of music wire was a Collins product.

Well now, Steve's idea isn't as crazy as it seems. Realize that a
1/4-wave cavity at 432 MHz is a 3/4-wave cavity at 1296 MHz.
That'll look the same to the signals. The harness has to be redone,
but if you can tune the cavities *low* enough, they'll work just
fine.

Actually, the five Morse elements are:

1) the dot element
2) the dash element
3) the intracharacter space element
4) the intercharacter space element
5 the interword space element

When using OOK modulation, the latter three elements
are unvoiced, IE they are represented by no signal energy.

>interval can be determined.

This is *not* matched filtering. A matched filter has an impulse
response which matches the impulse of the element. If we integrate
the signal energy from such a filter, we get an amplitude maximum
at the end of the element period. If we set our slicer to make the
decision at this point, we will have extracted the most usable
information about the element from the system. We *do not*
slice then filter.

But a zero energy element has no impulse around which we can
form a filter, and no energy to integrate to form the amplitude
peak to slice. Nor, with variable element length coding do we have
a clocking reference to decide when the element interval is over so
that we can perform the slice function at the proper time.

>In Morse code there are 3 "signal not present" intervals. As part of the
>Morse code translation by a computer we would like to be able to
>identify these three intervals. They contain valuable information about
>the Morse signal, especially when it is transmitted from a computer.

The space elements are essential parts of the code. Regardless of whether
a computer is involved or not, we must determine the presence or absence
of these elements in order to decode the message. But they are unvoiced,
we can't do matched filtering for them or integrate and dump the energy
representing them, since there is none.

Instead, we must *infer* their presence by the (apparent) lack of one of
the voiced elements, IE the dot or the dash. Thus 3/5ths of the information
necessary for Morse Code decoding must be regenerated from the (apparent)
absence of the other 2/5ths of the elements. This costs us a *minimum* decoding
penalty of 10*log(2/5)= 3.979 db compared to a modulation and coding which
voices energy for every element. The penalty is actually larger because we
*still* can't be sure which of the three unvoiced elements is implied by the
absence of one of the voiced elements until we *do* receive another voiced
element. Since Morse is not a synchronous code, this delay could be any
arbitrary length.

>We can do this by assigning a matched filter for each of these three
>intervals (after the logic inversion that I mentioned). These three
>filters, combined with the dot and dash filters, can then be sorted out
>by the computer and decoded, character by character (using a lookup
>table), word by word and sentence by sentence.

As noted above, we *cannot* assign a matched filter to the unvoiced
elements, there is no impulse to match.

>As I have said previously, a major problem is deciding the threshold
>level that we use to decide "signal present" and "signal not present".
>It depends on the signal to noise ratio. Computer algorithms are
>possible that calculate an optimum value for this threshold "on the
>fly".

The use of a matched filter maximizes the Hamming distance in signal space between the element and the background noise. But since we can't match filter Morse, we are left to assign an arbitrary slice value. Depending on the channel filter bandwidth we are using, this slice level can be very far from optimum, and we can't improve it in any systematic way.

>Also, the receiver design must be optimized for weak-signal Morse
>reception. One thing that we can take advantage of is the difference in
>the spectrum of a single frequency tone in the "signal present" state

>with adaptive filtering and correlation techniques can be used for this.
>For example, suppose we adjust the receiver for a 500 Hz tone. A special
>correlator algorithm is then an excellent filter for that 500 Hz tone.

What we want is a channel filter which is the concatenation of the matched filter impulse responses for the code elements. This gives us the optimum filter assumed by the Shannon relation. But we can't do it, because we can't form matched filters for 3 of the 5 elements of Morse. Note that the highest modulating frequency for 20 WPM Morse is 8.33 Hz. Any filter wider than that will degrade SNR for the dot element, but even a filter that narrow is still too wide for the dash element, which has a maximum modulating frequency of 2.777 Hz. In actual mixed element transmission, the average frequency will be even lower than these maximum values. So using a 8.33 Hz channel filter will result in degraded SNR for all transmissions except endless strings of dots.

Note that the 500 Hz mentioned above is an *Intermediate Frequency*, it is *not* demodulated OOK Morse. As noted, the highest frequeny you get from demodulating 20 WPM OOK Morse is 8.33 Hz. Since humans can't hear frequencies that low very well, we've trained ourselves to make sense of the (AM) modulated carrier *directly* rather than demodulating the signal and listening to the modulation, as we would for analog voice for example. This costs us yet another 3 db because we must copy the double sided PSD rather than the single sided PSD since we're listening to the AM modulated carrier rather than to the modulation itself.

>Finally, I want to make a few things clear so that I will not continue
>to be misquoted, misunderstood and subjected to diatribe:

>signal to noise ratio and the determination of the threshold level.
>Also, the determination of the "dot" or "dash" and the three space
>intervals presents further problems.

Indeed that's true. What is also true is that your statement that we can form matched filters for the 5 Morse elements is false. We cannot, and that is one of the basic limitations which plague Morse as a weak signal method. Morse is always at a disadvantage to a uniform code because of this inability to match filter the signals.

>2) Nevertheless, I believe that CW operation is a valuable asset for
>Amateur Radio operations. There is more involved than purely technical
>merit. These factors involve the following:
>
>a) The long historical interest in CW. This is not the same as

>think that they have legitimate right also. These people pride
>themselves on the CW skills that they have acquired through long
>practice. I don't think that they (I include myself) want the opinions
>of some highly vocal opposition group shoved down their throats.

And most definitely vice versa. No one is saying you can't use Morse, only that you can't claim advantages for Morse that it does not possess. People routinely use even worse methods, analog voice for example, and few complain about that. It isn't *usage* of Morse which is an issue. It is the undeserved pedestal on which it has been placed that is at issue, particularly with regard to license examinations.

>b) It is a fact that CW, under weak signal conditions, can get through
>where others fail. There are two reasons for this. The xmit and rcv
>bandwidths are narrow, which *reduces* adjacent channel interference.
>Also, Shannon's equation supports the idea of a very slow message that
>is sent in a very narrow bandwidth. The SETI folks know all about this
>idea.

But Shannon's equation also tells us something else, and that is we can use a *larger* signal bandwidth to work in even weaker conditions. In fact, Shannon's relation tells us that if we desire to work at the theoretical minimum possible signal level, we have to employ signals of infinite bandwidth. But Shannon's relation *assumes* we are using a matched filter response, and thus a code which *allows* us to obtain a matched filter response. Morse doesn't, so Morse cannot even approach the Shannon limit. Thus your false statement about CW getting through where others fail is the crux of this matter. You yourself admitted above that OOK Morse is suboptimal, yet you persist in this false claim about its abilities. Sure, Morse can beat *some* other methods, but just as surely, it is soundly beaten by other methods.

>c) There are a lot of low-budget, low-tech QRP types world-wide who want
>to get started in Amateur Radio with simple gear that they put together.
>CW is an ideal vehicle for this.

I wouldn't call it ideal, certainly a FSK system is only a transistor and capacitor (or a varactor) across the frequency determining element away from OOK, yet it offers a 6 db improvement in information transfer over OOK. Using a code with uniform elements adds at least another 3.979 db

to that. Such uniform FSK codes *can* be decoded by ear provided they are sent slowly enough, IE at speeds comparable to typical Morse speeds. No one bothers to do it because machine decoders can do it so much faster, but one *could* do it if you wanted a minimalist QRP setup which would outperform OOK Morse.

>d) Regarding the testing of Morse for licensing: I think it should be
>retained in some minimal sense, say 5 wpm. Reason: it makes sense for
>Amateur Radio, for the reasons that I have mentioned.

You have given reasons why one might want to *use* OOK Morse, even though there are better alternatives, but you haven't given *any* reason why there needs to be a Morse speed test as part of a licensing exam. Usage of any modulation or coding is strictly optional for an amateur. The government recognizes that. And there are no speed tests as separate pass/fail elements for any other modulation technique or text encoding method. Only Morse is on this special pedestal. But there is no justification for it occupying that position in law. It serves no legitimate government licensing purpose anymore. (It once did, when amateurs were intermingled with government and commercial life safety stations who needed a way to tell amateurs to cease interfering with them, and only had Morse by which to do so. But that day is long gone.)

>The reason the
>military has eliminated it is *partly* because of the time and cost of
>training operators that can copy 25 wpm on a typewriter with no errors.
>When the person finishes his/her "hitch" they have to do it all over
>again to a new group. The other reasons are technological and I have no
>arguments about any of that. It is certainly simpler for an operator to
>bang the keyboard, then push a button that puts a completely error-free
>message through.

It is simpler, but more importantly, it can be faster, error free, and can operate in conditions where OOK Morse fails. It may also have LPI and jam resistance which OOK Morse cannot offer.

>e) Aside from all of that, I certainly believe that Amateurs should
>become involved in the more advanced technologies. I am certain that
>there are many operators who operate data modes and SSB and also enjoy
>operating CW. Why CW? Because they want to! Isn't that reaon enough? And
>they don't need to be belittled or bullied for it.

But the vice is definitely versa here too, Bill. Constantly repeating the Morse Myths, belittling the operators who have chosen not to use Morse for sound technical reasons, bullying amateurs and prospective amateurs to pass faster and faster Morse speed tests, etc, is why you have the sort of thread your comment generated. As long as the Morse Myths continue to be propagated as the dominant amateur belief, what would lead amateurs to try more advanced methods? Their elders are telling them that Morse gets through where all else fails. That's patently false, of course, but it takes a strong will to buck the dominant religious

belief, especially when it is backed by government force via the testing system. Thus it serves as a strong damper on technological progress, and sound technological education, in amateur radio.

Note carefully I'm saying nothing about *usage* of Morse. The only reason you need for that is because you want to, that's the very same reason someone may give for using AM phone, or running SSTV, or doing ATV, etc. But note very carefully that none of those activities has a burdening mythology, or separate pass/fail government tests associated with it. Use or non-use of any of those other techniques has no bearing on whether a license will be granted. Only Morse Code holds that unique position. But there is no good reason why it should.

Gary Coffman said:

> When using OOK modulation, the latter three elements
> are unvoiced, IE they are represented by no signal energy.

I did not say that they contained energy. I said they contain information. There is as much information in the interval between signals as there is in the signal itself. The "zero" is as important as the "one". You *must* try to remember that, if possible, in your zeal to promote your anti-CW agenda, which I'm not sure that I fully appreciate.

> This is *not* matched filtering.

If you invert a "zero" to a "one" you can make a matched filter for that interval. The idea of a time domain matched filter in this case is to estimate the *duration* of the zero in the presence of noise. This is one well known application of a certain kind of matched filter.

> Nor, with variable element length coding do we have
> a clocking reference to decide when the element interval is over so

One function of the processor is to determine the clock, just as in many kinds of serial data tranmission in a noisy channel.

Sabin said >>:

>representing them, since there is none.

Nobody said they were "voiced". But they are important pieces of information. The "energy", to use the word loosely, is in the inverse of the "no signal" state. You are absolutely off-base in this matter.

>Since Morse is not a synchronous code, this delay could be any
>arbitrary length.

Morse sent by computer is synchronized at the sending end. It can be synched at the receiver adaptively. You are wrong about that also. Coherent CW is one example that uses accurate clocks at both end. The

receive clock is synchronized by the noisy signal.

>>We can do this by assigning a matched filter for each of these three

Once more, the "impulse" is the inverted "no-signal" interval.

>>As I have said previously, a major problem is deciding the threshold
>>level that we use to decide "signal present" and "signal not present".
>>It depends on the signal to noise ratio. Computer algorithms are

>The use of a matched filter maximizes the Hamming distance in signal >space
>between the element and the background noise.

I know as much about matched filters as you do. In fact, I'm beginning
to think maybe I know a lot more. There are applications that use
sophisticated algorithms for estimating time durations in the presence
of noise. These systems synch a clock from the noisy signal.

My previous remarks on this subject are correct. You are absolutely
wrong in saying that Morse cannot be match filtered. Your understanding
of this subject is not as encyclopedic as you think it is.

>>Also, the receiver design must be optimized for weak-signal Morse
>>reception. One thing that we can take advantage of is the difference in

>can't form matched filters for 3 of the 5 elements of Morse.

More of the same baloney. We want the best estimate of the time duration
of *all* of the various intervals, as corrupted by noise. The noise
power is the same, "signal present" or "signal not present".

> Note that
>the highest modulating frequency for 20 WPM Morse is 8.33 Hz. Any

>transmission, the average frequency will be even lower than these

>maximum values. So using a 8.33 Hz channel filter will result in >degraded
>SNR for all transmissions except endless strings of dots.

The filters are software filters that are adapted to the code rate. The ensemble of filters is for the ensemble of time durations and also for the determination of "signal present" and "signal not present". An adaptive threshold detection is also important.

>Note that the 500 Hz mentioned above is an *Intermediate Frequency*,
>it is *not* demodulated OOK Morse.

More baloney. It is not an "intermediate" frequency. A software correlator can detect a weak 500 Hz tone in the presence of noise in the output of a *product detector* which, by the way, is an excellent detector for a Morse signal.

>As noted, the highest frequeny
>you get from demodulating 20 WPM OOK Morse is 8.33 Hz.

What kind of nonsense is this? No one listens to these frequencies, they listen to the beat note from a product detector. A computer can do the same thing, monitor the audio beat note out of a receiver.

>>Finally, I want to make a few things clear so that I will not continue

>uniform code because of this inability to match filter the signals.

More baloney. A set of different matched filters can be sorted out by the processor by means of "voting", which is a common technique for separating intervals of different duration. Try to remember that the main exercise is two things:

1) Is the signal present or not present?
2) What are the durations of the constituents of the signal?

>>2) Nevertheless, I believe that CW operation is a valuable asset for
>>Amateur Radio operations. There is more involved than purely technical

>And most definitely vice versa.

I do get a little tired of guys like you who keep bellyaching about the
problems with Morse code and refuse to see its utility in the practical
world of Amateur Radio communication. The attitude is that if it isn't
technologically wonderful, it is useless and has to be thrown out. Bull!

As a matter of fact, the superiority of data modes requires a processor
of some kind. But you like to compare this with a human Morse operator.
Put the processor to work on Morse and ***SOME*** of the difference
disappears.

>No one is saying you can't use Morse,

Gee, thanks. That's big of you.

>only that you can't claim advantages for Morse that it does not >possess.

Find one statement of mine where I claimed any technical advantage. Just
one.

It is the undeserved pedestal on which it has been placed that
is at issue, particularly with regard to license examinations.

The "pedestal" is your creation. Did I say anything about a pedestal? I
do believe in Morse for licensing, say 5 wpm. To repeat, I think it is
*right* for ***AMATEUR RADIO***.

>>b) It is a fact that CW, under weak signal conditions, can get through
>>where others fail. There are two reasons for this. The xmit and rcv
>>bandwidths are narrow, which *reduces* adjacent channel interference.

>>idea.

>But Shannon's equation also tells us something else, and that is we can
>use a *larger* signal bandwidth to work in even weaker conditions.

I don't need any condescending lectures from you about Shannon. I know
as much about that subject as you do. Probably more.

>>c) There are a lot of low-budget, low-tech QRP types world-wide who >>want
>>to get started in Amateur Radio with simple gear that they put >>together.
>>CW is an ideal vehicle for this.

>I wouldn't call it ideal,

I don't care what you call it, from a technical perspective. My statement was that under the conditions in the above paragraph it is an ideal way to get a leg up on beginner-level radio communication. As usual, you want to twist it around and try to make it look like I said something else.

>>d) Regarding the testing of Morse for licensing: I think it should be >>retained in some minimal sense, say 5 wpm. Reason: it makes sense for >>Amateur Radio, for the reasons that I have mentioned.

>>e) Aside from all of that, I certainly believe that Amateurs should >>become involved in the more advanced technologies. I am certain that >>there are many operators who operate data modes and SSB and also enjoy >>operating CW. Why CW? Because they want to! Isn't that reaon enough? >>And >>they don't need to be belittled or bullied for it.

Let me make one thing clear. I never made any claims about CW being ideal, or anything close to that. But I do get fed up with this kind of condescending, patronizing and mindlessly faultfinding lecturing. I am not impressed with your "superior" knowledge on this topic. For example, you keep saying over and over that the duration of a "no signal present" state cannot be estimated in an optimal manner. You just simply do not know what you are talking about. Also, you deliberately twist and misinterpret my carefully balanced and impartial statements to suit your own narrow point of view. That is your privilege, I guess. It is still a free country and you can do just about anything you like. I really don't care, except that I don't appreciate the "smear job" whose main purpose is to discredit by any means that can be concocted.

That is odd. I find this database to be quite old. It is behind
despite what it tells you is the last update to the database (Last
database update 1997-10-01 11:07). For instance, I upgraded to
Amateur Extra on 03 Jun 1997 and it still shows me as an Advanced.

You can also get the data sheet in PDF from Analog's web site (www.analog.com). This is a neat chip, but you're not going to get very far without the information on it...

Has anyone else had the interest to interface this chip to a Mac serial or printer or ethernet port? I'm not thrilled about doing it myself since I have a lot of other stuff going on. Never have seen anything in QEX or other sources about use with Mac.

Hardware plus C source code routines would be the goal.

Rob.

No kidding. I wish I'd known about the 7008 before I hand-wired a 68-pin Qualcomm PLCC to a surface-mount Harris 12-bit DAC. :-( Had no idea they were making integrated DAC/DDS chips!

Anybody want to buy 4 Q2334-50's in prime condition (had to buy 5 to meet Qualcomm's $150 minimum order)?

"WRONG"
Connect a signal generator and adust the level to somewhere the audio
noise increases fast when generator output level is reduced. Some
technicians prefer to use some weak tone modulation, 500Hz tone and
0.5kHz deviation.
It is very easy to TUNE the receiver RF stages and reduce signal
generator level as signal to noise is improved.

Feel free, say anything you want. I can ground an emitter and let it's stud stick outside of the shielding for cooling and still keep the RF inside the shield. When the stud is connected to the collector, as so many devices are, it's tougher.

Is there some particular reason you keep doing this?

>

I also have a copy of that article and found it interesting. However these days I wouldn't be inclined to build an AM hand held rig with a superhet receiver. Instead, I'd go for a direct conversion job with a DSB transmitter included. This would make it more compatible with modern equipment and allow much further distances to be covered.

As for the frequency control, either a JA-style wide-swing "Super VXO" or a 3.58 Mhz ceramic resonator VXO multiplied by two would be the simplest approach.

I wonder if anyone has tried building hand held DSB/SSB gear for 7 MHz and the results achieved. I remember seeing advertisements for commercial handheld rigs covering 40 metres (Mizuho, Tokyo Hy-power?) in one of the American magazines.

Certainly the ideal project to be thinking about right now would be a handheld DSB rig for 10 metres - the antenna could be made fairly efficient, and long distance QSOs should be possible. Also, it should be easy to cover at least a 100kHz tuning range if using a VXO multiplied up from a lower frequency.

Not sure, I never saw that article. I ordered them for an experimental project. I wouldn't recommend the Q2334 for any new designs; it works great and is easy enough to get running, but the AD7008 would be *much* easier to use due to its integrated DAC.

If you like, give me your addr, and I'll drop one in the snail mail to you gratis. I definitely don't need 4 spares of a chip I have no intention of using in anything else.

## 3237. Serial port demodulator

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-03 00:00:00 UTC
From: kc8wf <b757@concentric.net>
Message-ID: <01bcd038$322a24e0$84869bcf@crc3.concentric.net>
Source record: 90325

Can someone help me figure out how a serial demodulator works. This demodulator is a simple device which plugs into the serial port. Its made using a OP-AMP (see - www.accessone.com/~tmayhan/schem.htmand - for schematic), and apparently takes the audio input signal from the radio, changes it into a varying square wave, and outputs it to pin 6 of the serial port .

My question is how does the software pull out the information, and how is it that the software can monitor pin 6 and not use the normal input pins of the serial port, to receive data?

Many thanks,
Simon (KC8WF)

Analog Devices has some newer, more power-efficient DDS chips
with integrated DACs ... check their web page ... the 7008 is a bit
on the elderly and power hungry side compared to the new ones.

# 3239. Re: Tube substitution in Swan finals

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-03 00:00:00 UTC
From: Patrick Keogh <keogh@netnet.net>
Message-ID: <613p5b$h9c$1@news.inc.net>
Source record: 90327
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Wow...why do people do things like replacing sweep tubes with 6146's!

I just purchased a new-old-stock matched pair of Sylvania 6HF5's from Antique Electronic Supply of Tempe, Az. Seems that they have lots of already matched pairs in warehouse bins...they did not charge me extra for matching (I asked the salesman over the phone if he could check stock to see if he had Sylvania...these were the matched pairs). Price was $34.00 with shipping. Not bad considering real 6146B's are twenty bucks each.

I would recommend replacing the 6146's with the 'HF5's only if you are experienced with such surgery and are willing to track down the sockets for the 'HF5's (this may be more difficult). Neutralizing a Swan of this vintage is a little tricky also.

Good luck...don't get in too deep. Remember, if all else fails, you still have a fine receiver!

The easiest and cheapest way to obtain one per second pulses is to obtain an old battery powered wall clock. A large signal can be found driving the sweep second hand. Of course the chip can be dug out if necessary.

Thanks to Lou for his help with Mike's problem. It was the 1 response out of about 6 that dealt with Mike's question and not his legitimacy.

Mike, you didn't mention if you were in a rural or suburban location. If repeaters are within about 5-10 miles of your QTH, a handheld, near a window will work, just fine. Other options are the Larsen on glass antenna which can be stuck to a window and will work well with local repeaters.

Hope this helps.

>Five13@aol.com
>http://member.aol.com/WB1Yuki/index.html

The equivilent circuit provides information on how far a crystal pulls.
The mechanical construction of the crystal determines the equivilent
circuit.
A flat rather than a planoconvex crystal will pull further because the
Inductance to equivilent series capacitance ratio is lower.
Unfortunately a flat crystal has to be bigger in diameter than a
contoured crystal. A 1MHz crystal only just fits in the standard holder
therefore it has to be heavily contoured. A fundemental 20Mhz crystal
has lots of room therefore it is flat, and should pull further in
fractional terms, (overtones pull less anyway) . For maximum pulling the
crystal should be pulled above and below series resonance there are more
spurious responses above series resonance , another and seldom realised
reason for operating below series resonance.
The crystal reactance at a particular frequency may be "diluted" by
series or shunt reactance/resistance to increase pulling clearly this
will also reduce the stability. Two crystals at the same frequency will
pull further for the same reason, the reactance will halve. Each crystal
will still be a seperate resonator . Parallel BT cut crystals with
parabolic temperature coefficients have been employed to temperature
compensate each other.
In 1947 Marconi employed a VCXO by Mortley for direct broadcast FM the
flat crystal was carefully designed for minimum spurious by employing
energy trapping this technique was re-discovered and enabled monolythic
crystal filters to be constructed.

My fellow solder melters:

Lately I've been looking through a large pile of old ham radio magazines, looking for interesting homebrew projects.

The November 1963 QST has an article that caught my eye. Timothy Hulick, W9MIJ, described a very neat little solid state 7 mc. homebrew Handi-Talkie. Superhet rx with a 455 kc if. Very nice job.

What I found most interesting about the article was the circumstances under which Tim built and tested his rig. He built it while he was a Midshipman at the U.S. Naval Academy! (Those are some busy folks.) Not only that, he notes that "Unfortunately I was unable to get much use out of it while at home on leave, so I took the rigs with me to Penascola and Jacksonville, Florida and with the aid of W4NEK, gave them some trial distance tests at the naval air station where I as undergoing my introduction to naval aviation." FB OM! That's true dedication!

I did a QRZ callsign search for Tim. I found an Extra class ham with that name listed as W9QQ. I'll bet that's him. If anyone knows him, please pass along my congratulations on a FB HB effort.

You can try to linearise 7360 with some negative feedback, too!!!

The main benefit using of 7360 in mixer configuration is from fact
that it always works while being in it's most LINEAR range - 100% of
time!

On contrary - almost all other devices used in mixers circuits
are driven from its best linearity point (at least - for a little
fraction of time) by heterodyne and much smaller interferences can
distort
useful signal at these moments. No matter what devices are used -
linearised or not, bipolars, FET's, or tubes, no matter - how many
gates or grids are used for mixing. All they are in NONLINEAR region
at these moments!
Brute force can help - you must feed mixer with plenty of
heterodyne - to ensure that any interference will not counterweight
hetrodyne's action. Fast switchers can minimise fraction of
non-linearity time.

Sometimes this works, sometimes not - as in modern multi$$$ boxes for
hams...

7360 uses beam deflection for heterodyning - this doesn't act on
linearity.
Just pure mathematical multiplying - so you can get maximum for nothing
(almost),
except that you'll generate some heat and light...
And if you like brute force - 4CX250 (four pieces) in double balanced
configuration is the best solution...

Xcuse - if I was speaking abt well-known things. I just pointed to one
aspect
of the problem, and agree 100% (almost ;^) with you, oldtimers,
elsewhere.

Had a great pleasure to read!

It seem's I'm off-topic a bit ...

Every so often I see an electronic design aid implemented with
EXCEL spreadsheet. I only own Quattro Pro spreadsheet but have been told
there are macros or other schemes that allow Quattro Pro to execute
EXCEL design tools.

I am looking for those macros or other schemes allowing Quattro Pro to
run EXCEL design aids. Also looking for sites with RF and Audio design
aids built with EXCEL.

Thanks for any thoughts.

I am wondering if a modern low band VHF-radio with CTCSS would be compatible with military radios (e.g. prc25, prc77) that uses 150 Hz tone-squelch?

The closest CTCSS-frequency seems to be 151.4 Hz. Will that be close enough to open the squelch on the military radio?

US military FM transmissions employ wider deviation than
(USA) VHF land mobile stations and are too wide for
land mobile receivers with decent IF filtering.

The squelch on a narrow band FM receiver often slams shut
on voice peaks when listening to wider military FM signals.

Indeed so, but they have been made for some time. Half lattice and ladder structures are possible, but excellent control of the quartz processing is needed to get filter shapes in spec and to control any nearby spurious modes.

One interesting approach is to embed crystals in an LC filter structure to get a little more design freedom, giving a sharp bandpass filter in the middle of a much wider LC filter response. This sort of structure is normally avoided like the plague, but is often the only approach for crystal BANDSTOP designs, yet it offers a few different tricks if used for bandpass designs where it is not normally considered to be necessary.

> HOWEVER, having said this, one of my contacts at Jan Crystal in Florida

> the right person at Jan, email me and I'll give you the engineer's name.

I've heard of experimental fundamental crystals approaching 1GHz in the form of a thin diaphragm micro machined in a hole in a much thicker support ring.
I suspect that very high freq fundamental crystals could be rather difficult to use and might prove rather fragile electrically.

Intermodulation distortion in crystal filters is now a serious problem with new mixer and amplifier designs being so much better than in the recent past. This gets worse with increasing frequency. Crystal non-linearity could be a significant problem.

Cheers

> Larry ve3fxq

Robert Lay said it, "What a marvellous question"

Spread spectrum isn't around the corner, it's been here for some time in all sorts of commercial and military applications. Adoption on the amateur bands is another matter altogether. No one entity owns the entire amateur system, so the inertia in implementing something new across a significant proportion of the population is rather large. Some people have experimented with it, but it has so far failed to excite people in bulk to build gear, nor has it impelled a major manufacturer to produce equipment for the amateur market.

Amateur radio is not really going anywhere at the moment, the vast bulk of the population (including me) is stalled, just doing the same old things while a very small minority are actually doing any serious exploration of new things. When/if one of the experimentalists finds something that captures the imagination or curiosity of enough others, then the hobby will move a little in adopting it.

Things we need:

1) High speed microwave backbone to speed up packet radio traffic, evolving into a system with faster links right down to the user nodes.

2) Argument clusters, specialised packet structures (like the DX clusters that now so successfully synchronise our pile-ups), where all the Morse/no Morse immortal debates can be re-located, and keep the pro/con arguments for each national society company.

On the Morse decoding matter, Morse sent with a regulated speed and element length has a spectrum with comb-like characteristics due to its predictable timing, with complicated modulation on it due to the unpredictable nature of the text being sent. There are many different ways and levels of matching filters to this, considered either in the time or frequency domains. One method I'd wondered about trying is now

feasible due to the small number of symbols and the relatively low information rate - to build, in DSP, a bank of correlators. One for each Morse symbol and to compare their outputs. With all the talk of matching filters to the elements of the Morse symbols, why not take a step further and match to the symbols themselves? Spaces are important too and the intersymbol space would need to be included in each symbol correlator, because that's all that stops "L" being read as "E, T, E, E"

I agree with Bill that this could be great fun, and very satisfying to get something going, but if we are going to consider dramatically more elaborate detection schemes than ever before, then we ought to at least consider that changes to the coding of the signal to suit the possible decoding methods could also yield some further benefit.

I can't remember the source but theer was a quotation like:

"Space is what stops everything being in the same place"

Cheers
David

From: philip de cadenet <phil@two-way.demon.co.uk>
Message-ID: <OpvMnYAJypN0EwSg@two-way.demon.co.uk>
Source record: 90336

I'm looking at generating a high current charger for a 48V battery bank
from a 12V source. This is for a QRO 50V FET HF mobile amplifier.
Two routes have come to mind, a 48V alternator or a DC to DC inverter.
Well AFAIK niether Leece Neville or Lestek produce alternators with this
output voltage so can anyone recommend another company?
Alternatively I'm after an inverter, either a circuit design or a
complete unit, I don't feel comfortable designing one of these switching
rascals.
I need an output of around 1KW at 50V.
Any ideas, suggestions or constructive comments greatly appreciated.

Phil G4ZOW/M

You can download software from www.analog.com, I have a dos version that talks to the printer port but so far I am unsuccessful getting it to run.

Hi
I have tried to find what is the real differences between the
different versions of the same IC, but it seems too difficult.
Do you have any idea?

I believe I have all available information from Philips (Signetics)
books.

Please do not reply if you do not have a definite reply to give!
Please do not tell me an internet site where you think the info might
be found, it is not obvious to see it.
Please do not tell me about a person whom you think will know.
Too often when a questioned is asked, one receives a lot of "info"
without any value to the question, but it is of course OK to discuss
some different topics under a title when the actual question is
replied to.
Several persons have tried to judge the information to learn any
possible difference.

Actually, no, it has to have nonlinearity to act as a mixer. It gets that
when it switches, via beam deflection, from one plate to the other.
The switching is not instantaneous, it takes a finite time to sweep
the beam from one plate to the other (which is proportional to the
voltages applied to the deflection electrodes). This is analogous to
the turn on/turn off time of the diodes in a diode ring mixer, the
harder you drive it, the quicker it switches. As the beam sweeps
off one plate, across the gap, and onto the other plate, you get the
familiar square law response (the beam has a finite spot size).

There is an example of using this tube as a balanced modulator
in the 1963 ARRL Handbook, pp 307-311. It does carrier
oscillator duty using cathode, control grid, and screen in a
Pierce circuit, and the portion of the beam passing through
the screen is then switched between the two plates via audio
introduced on the deflection electrodes, producing DSB in
the balanced tank circuit. In this design, that signal is then
link coupled to a McCoy 9 Mc crystal filter to produce SSB.

After a fashion, you might consider this a tube integrated
circuit since it combines different functions in the same
envelope.

The important thing for Morse is to try to determine, in an optimal manner in the presence of noise, the time lapse between 1/0 transitions. This is really what Morse machine decoding is all about.

As part of that, correlation dot/dash filtering of an audio frequency tone, at the output of a product detector, is superior in terms of Eb/N0 for 10^-3 bit error rate, to envelope detection. Envelope detection concerns the Rician distribution (weak signal plus noise) and the Rayleigh distribution (noise only), which are not really all that great. A product detector plus correlation filtering is practically the same as coherent, or synchronous, detection because we are looking at AWGN that is *translated* to baseband. The improvement is at least 1 dB.

We also need an adaptive threshold detector that determines the 1/0 transitions in this AWGN background. We then "time" the no-signal interval in an optimal manner using time domain filters.

To get any better than that, for a better channel capacity, according to Shannon's equation, we must increase the transmitted bandwidth, which in my opinion is a real bummer for the CW portions of the HF amateur bands.

One thing that is not generally realized is that FSK is only 3 dB better than OOK but requires a considerably wider bandwidth.

David's idea of optimizing the symbol set in some way may be a good one. I am not able to say how we might do that.

My main concern is what we have all seen over the years. The so called big time high tech improvements turn out, in the end, to be nothing but smoke and mirrors, a big pain in the butt.

If I wished to impress anyone, you wouldn't even make my list. A gentleman wanted info on the device and I passed it along. The observation that the stud was isolated was a casual comment.

>>Is there some particular reason you keep doing this?
>Sometimes I have used 2N3375 and 2N3632 with -24 or -28V supply

That's nice, most people don't.

>with collector to stud it is a good idea to use an "emitter follower"
>type amplifier (operates like common emitter), I tested 4x BD139 in
>QRP 10m and 20m amplifier, G3VA presented my amplifier in Radio
>Communication about 10 years ago

That's nice too. Pat has published some of my stuff also, I don't consider it a license to criticize. I needed voltage gain, not power gain. It was "simpler" as I commented initially, to go common emitter rather than common collector and a transformer. An emitter follower, does NOT operate like a common emitter.

Not much going on in Norway eh?

This might help. This program is written in Qbasic. Just conect pin 1 of
LPT1 to ENB, pin 2 to DAT and pin 3 to clock. Make sure d and c = address of
lpt1 and lpt1+2 respectively. You can replace the string f$ with any value
to set the frequency you need. Hope this helps.
Pieter N4IP

```
Rem AD7008 Control Program
Rem This program Sets frequency to 14,000,000 HZ assuming 50 MHz clock
Rem pin1=enb, pin2=dat, pin3=clock

d = &H378 ' LPT1
c = &H37A ' LPT1 STROBE CONTROL
OUT c, 1
f$ = "01000111101011100001010010000000"
For SD = 1 To 32
V = Val(Mid$(f$, SD, 1))
If V = 0 Then OUT d, 0: OUT d, 2 Else OUT d, 1: OUT d, 3
Next SD

OUT c, 0
OUT c, 1

>My 465 Tektronix oscilloscope went belly up with no sweeps displyed on
>the tube.

I experienced the same problem with my Tektro 453. I don't know how the schematics of your 465 is, but the high voltage unit is probably out of order. First, check the fuse and the driver transistor on the primary of the high voltage transformer. To see wether you have high voltage on the secondary, you can check it carefully, testing the -1950 Volts on the kathode (you have a check point on the high voltage unit). If the -1950V is out, you have no oscillations in the circuit. Check the primary coil of the transformer with an ohmeter. At last, check all the high voltage section rectifiers and capas. Not with an ohmeter because they probably fail working under high voltage only.
Please let me know.
Good luck.

>> I think I am missing something here. I thought the SBE-33 was the first
>> all solid state transceiver, not tube. I believe the SBE-34 was also
>> all solid state.

No... the SB33 and the SB34 are nearly identical in terms of circuit design. There are two main differences. The SB34 includes both 117VAC and 12VDC power supplies while the SB33 includes only the 117VAC supply (the 12VDC was an external option). Also, the SB33 was constructed using 1950's techniques (transistors socketed as if they were tubes and point-to-point hand soldered wireing) while the SB34 was constructed mainly on printed circuit cards.

I happen to own a functioning SB33, The good news is that I also have the manual for it. The bad news is that it's currently stored in another state, so I can't easily get a copy.

If the problem is a need to shift the specific frequency coverage of a specific band, it's a matter of identifying the crystals for the 1st converter and replacing the appropriate crystal with one for the desired range. There is no need to worry about damageing a crystal filter by mistake, the SB33/34 has no crystal filter = it uses a Collins mechanical filter which looks NOTHING like a crystal!

Good luck! - Seventy Trees - Glenn wb6w

You might want to check out my articles in QST about DDS chips. Those refer to the Harris parts but the idea is the same. Clock, Data and Transfer lines are needed to send a command to the DDS. You use the clock pin to tell the part that the data is valid. So set the Data to what you want (1 or 0) than flick the clock line. Thats the first bit! Now repeat for the rest of the bits that need to be sent than flick the transfer line (That tells the chip you have sent the command)
Tada! Or is that Tadah? Well whatever. They have samples of my code that is in QBASIC (Ugg! Only C is worse) or Assembler! Might fine stuff. Assembler that is. Not my code. <grin>

>
>Tony, AA9CC

Tony, the easiest way to adjust a preamp for best noise figure is with a pulsed excess noise source. A noise diode is biased to give you excess broadband noise, and the bias is then pulsed on and off at an audio rate. There are plans in the Handbook.

This is attached to the preamp input, and the output is monitored with an AM detector. Adjust the preamp for maximum tone output and you are done. Note, you'll want to play with bias as well as tuning to achieve best noise figure.

Note that even a bipolar preamp can have a satisfactory noise figure on 2m. A GASFET is not needed unless you need strong overload immunity. Then you want to use a *power* GASFET with a strong standing current. Power GASFETS rated in the 2-4 GHz range make satisfactory high intercept 2m preamps, see the Proceedings of the Central States VHF Conference for design details.

This is common practice for some audio transistors, but so far I have
not seen any RF devices having collector to stud, so I am not
impressed by your discovery.
>
>Is there some particular reason you keep doing this?
Sometimes I have used 2N3375 and 2N3632 with -24 or -28V supply

with collector to stud it is a good idea to use an "emitter follower"
type amplifier (operates like common emitter), I tested 4x BD139 in
QRP 10m and 20m amplifier, G3VA presented my amplifier in Radio
Communication about 10 years ago

Is noise diode arrangements so easy to find? I would rather say this
is a complicated way. A signal generator with reliable output level
attenuator is far easier to find than any noise diode arrangement.
The noise diode arrangement is necessary ONLY if your receiver has no
FM mode, and if you wish to measure noise figure, see also G4COM
Alignment aid.....
>
For 2m DX I use mastmounted (homebrew) BFT66 pre-amp (10mA current)
since 1980, it has several input filters attached and it measures
1.1dB noise figure. For 70, 23, 13, 6cm I use GaAs-fet pre-amps.

Wilhelm Sch�rings, DK4TJ (M�nchengladbach) describes an interesting
circuit in DARC 42. Weinheimer UKW-Tagung september 1997,
Scriptum der Vortr�ge:
Spannungsmessung mit PC - am Beispiel eines mW-meter bis 1,5GHz
I received the book from this meeting some time ago.
he uses a 1SS99 with 12 bit AD serial converter to feed a PC
The actual reading is computed, so it is possible to show the actual
voltage in millivolt or dBm 50 ohm.
A problem is that lowest reading is 1mV, so levels between
-10...-20dBm will not have much accuracy.

My suggestion is to use a non-linear amplifier to increase the gain at
low end of level input, it is easy to re-calibrate for this
A CA3140E may easily be connected to have 11x gain below 0.5V DC input
and closer to unity above 0.5VDC in. This may improve sensitivity and
reading down to below -20dBm (22mV).

A Danish microwattmeter is on the marked in Germany, perhaps they use
some interesting technique to use cheap detector components?

Any suggestion for a non-linear amplifier to improve this circuit?

I would like to order a crystal for use with one of those 1-watt
CW QRP kits (which I also haven't ordered yet). Looking at the
JAN Crystals catalog, I see that they require you to specify
load capacitance and series or parallel resonance in your order.
Is there a standard all-weather response to these two specifications?

>
> Many thanks,
> Simon (KC8WF)

It's really pretty simple. The demodulator doesn't do much demodulating, and the computer does a lot of work.

As you note, the demodulator squares up the incoming audio. The op-amp is wired as a comparator rather than a linear amp in order to do this.

The computer watches for transitions in the output of the demodulator from high to low (or plus to minus). While the signal is high, the computer counts its own clock pulses. When the signal switches to low, the computer stops counting. The number of clock pulses tells it how long that half of the square wave was. That is, the pulse count is proportional to the period of the incoming audio at that instant. And the frequency of the signal is the inverse of the period.

Today's PCs can do this easily, because the audio frequencies are on the order of 2000 cycles per second, and the clock frequencies are millions of cps (Hz). So the computer may be counting several thousand clock pulses during each audio cycle, which yields good resolution.

> --
> 73, Cecil, W6RCA, OOTC (not speaking for my employer)
>

That was *exactly* what he tried to claim, before Gary, (I believe
Yin), and I jumped all over him ... he even went further to claim
that it is possible to build a matched filter for the non-existent
signal energy in the spaces between "dits" and "dahs" is absurd
and merely indicates that Mr. Sabin either genuinely doesn't know
what the hell he's talking about or was deliberately trying to mislead
the uninformed ... he also *conveniently* ignored the Morseodist
dogma vis a vis "simplicity" by not mentioning the fact that even
if it *was* possible (and it is NOT) to build his mythical matched
filter demodulator for Morse, it would be at least 5X more complicated
than a matched filter demodulator for BFSK and STILL wouldn't work
as well ...

This is probably what pisses me off the most about pro-code
fantatics ... their dishonesty and proliferation of outright falsehoods
and "voodoo electronics" as "facts" to "support" their cult religion.

If they could simply say "I like Morse, therefore I think everyone
should use it," or "I had to pass the test, so everyone else should,"
or "I think the Morse test keeps the phone bands from getting too
overcrowded," or any of the other *honest* reasons they have for
wanting to continue to force Morse on everyone, that would be fine.
They have a right to those opinions and to express them, even if
I don't like them ... even if *everyone_else_in_the_world* didn't like
them, I would still support their rights to those opinions ... I might
say that I thought the opinion was absurd, but I would still support
their rights to those opinions .

But one cannot spout total falsehoods as fact and not expect a
challenge ... especially when it *appears* that there may well be
a deliberate attempt to spread those falsehoods in an attempt to

mislead the masses and fraudulently enlist their support for a
cause that doesn't merit that support.

That's what pisses me off the most about the radical pro-coders ...

Hi,
I always interested in radio controlled stuff, like
radio controlled car, plane, boat, etc. I used to have a radio
controlled car (which I still do) and a radio controlled glider (i
never got it up to the air though!).
What I really interested to know is the receiver and the
transmitter
part. I have yet to find out how they actually work. I was just
wondering whether you know if there is any simple radio
controlled project/circuit around that I can build. I did look through
the web , but dont seem to find any. If you happen to have or
know a site, please let me know. Thanks in advance.

p/s: please reply to ccn011@email.mot.com if possible.

it is a circuit described and applied particularly in Germany, have
not seen it used much elsewhere, it looks like emitter follower, but
it is not. has 17-18dB power gain on 20m and 13-14dB on 28MHz
collector is grounded, input is a link connected electrically between
emitter and base, and output from emitter - like in an emitter
follower. It has the properties like grounded emitter, but no RF on
collector.

sometimes it has some advantage to build a stage using negative
supply, particularly when it is part a rig which already uses such
voltages. Unfortunately most hams considers 12V to be the only
acceptable voltage for transistor amplifiers, consider a power
amplifier running with 12V and 200amps.....
I like 24v...28V, but had some problems with some 48V designs
I have bought a surplus 500W RF output amplifier (0.5W input)
1.5-30MHz needing 40V 25Apeak, hope to have it running later.
It uses some thompson transistors, but they need copper type cooling
fins to be safe....

------=_NextPart_000_01BCD186.2142A590

Are you fed up of counting up and down manually you listing of the DXCC
countries in order to know your current status?
Are you tired of copying your listings of worked and confirmed countries
from one sheet to another every time there is an addition of deletion of a
country?
Don't you want to say "I have worked 150 countries, more or less" any more?
Have you ever spent an evening searching that paper or notebook where you
used to trace your DXCC status?

Here you have the definitive solution. The DXCC Worksheet.

HTTP://www.redestb.es/personal/g_sampol

What is the DXCC worksheet?
It is an Excel worksheet that helps you trace your status of DXCC
countries. You only have to fill the cells with your worked and confirmed
countries and the totals will be automatically updated. You don't have to
make any calculation !

What do I need for using the DXCC worksheet?
You need a computer running Microsoft's Excel Version 5.0 or 7.0(97)
Availability for former versions of Excel can be studied on demand.

Which are the facilities of the DXCC worksheet?
It provides an updated listing of the DXCC countries (including the deleted
ones). This listing includes:
Common prefix/prefixes
Name
Continent
ITU zone
CQ zone
Provides information on the date of insertion or deletion of the country.
Allows to enter data for any band from 160 m. to 23 cms. plus a
customizable band (3 cms, etc.).
Allows to enter separate data for SSB and CW plus a customizable mode
(RTTY, SSTV, etc.).
Automatically calculates:
Number of worked countries per band in SSB
Number of worked countries per band in CW
Number of worked countries per band in the customizable mode

Number of worked countries per band in mixed mode
Number of confirmed countries per band in SSB
Number of confirmed countries per band in CW
Number of confirmed countries per band in the customizable mode
Number of confirmed countries per band in mixed mode
Total number of countries worked in SSB in the WARC bands
Total number of worked countries in CW in the WARC bands
Total number of worked countries in mixed mode in the WARC bands
Total number of confirmed countries in SSB in the WARC bands
Total number of confirmed countries in CW in the WARC bands
Total number of confirmed countries in mixed mode in the WARC bands

How can I get the DXCC worksheet?
You can download it from my web site at:
HTTP://www.redestb.es/personal/g_sampol

------=_NextPart_000_01BCD186.2142A590

Look at the temperature ranges on the graphs. Fig 10 thru 13 for the 602 and 612 in the book I've got (1989 Signetics Liner:Communications). The 612 is only charaterized over 0 to 70 degrees C, while the 602 is -40 to +80 degrees C. (The current drain is has a higher max value, too).

This means that these parts have looser specifications and can be given a cheaper test. With simple jelly bean high frequency analog parts like this, testing can be major part of the cost. In order to test at the extremes, you need to heat and cool either the entire wafer full of chips, or the individual packages. (Electrical heaters in the hot case, liquid nitrogen in the cold case). And each temperature means a seperate run through the tester, either with a bunch of setup on your wafer prober or device handler, or requires a seperate tester installation. That stuff gets expensive.

Either that, or the 612's are fallouts that failed to work as 602's.

I've had plenty of feedback on my post above and yours is echo'd by
several other e-mails I've had.
I'm running a brand new Leece Neville 200 A alternator that I imported
from the US and this does fine on my QRP 8-pill which pulls around 150 A
on keydown.
I think I'll pay a visit to a local alternator shop and see what they
have to say. Do you happen to know what voltage rating rectifier diodes
are typically fitted in a 12/14V alternator, maybe I'll have to change
these as well?

Thanks

>signal into a 50 ohm unidirectional antenna.

The only bulletproof design would use a parabolic reflector, which at the
UHF frequencies you're using would have to be pretty large.

It certainly wouldn't be impossible to build, though, and
a transmitting antenna = a receiving antenna. The
angle is dependent on the size of the reflector: the
bigger the reflector, the smaller the angle and thus
the more directional the antenna. I don't have the formula
for it, but it's common enough and should be in any electromagnetics
text.

The only advantage to building a dish for low frequencies is that you
don't need a very substantial one: you could build the thing out of
chicken wire and still have a very efficient reflector. But you'll still
need a pretty large structure: I'm guessing something about 10-20 feet in
diameter, depending on your application.

another problem using 6146 type instead of sweeptubes is
6146 type never live 18-20 years with heater voltage on. 6146 sicken
and emission decreases when not operated, while the sweep tube does
not have such problems. The 6146B may not last 5 years, while many
sweep tubes may still work after 20 years.

## 3310. Motorola MaxTrc 300

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-05 00:00:00 UTC
From: scotter1@aol.com
Message-ID: <19971005112201.HAA28681@ladder02.news.aol.com>
Source record: 90288

I picked up a maxtrac300 at a yard sale of all places for $4.

It worked in the sense that 12 volts made the lights come on and the monitor switch made it hiss.

Anyone have a suggestion as to how do something useful with it? It apparently needs a dedicated programming computer or interface (the former, knowing Motorola). Any work-arounds or mods in this regard?

Any help appreciated, vie posting or e-mail.

If you have already done the demod and "sliced" the signal to
"1s" and "0s" you are not building a correlation demod, just
trying to do some simple pattern matching on what you have
already decided the bits to be in an effort to automate the
translation of a serial bit stream to Morse characters ... this is
NOT demodulation ... and it's not what we were talking about
vis a vis Mr. Sabin's mythical "matched filter, integrate and dump
Morse demodulator" ... that was nothing more than "voodoo electronics."

> > With all the talk of matching
> > filters to the elements of the Morse symbols, why not take a step

Same answer as the preceding paragraph ...

> > I agree with Bill that this could be great fun, and very satisfying to
> > get something going, but if we are going to consider dramatically more
> > elaborate detection schemes than ever before, then we ought to at least
> > consider that changes to the coding of the signal to suit the possible
> > decoding methods could also yield some further benefit.

Amen ... why use what is arguably about the worst possible encoding
scheme, when far better ones are available? (answer: religious dogma)
Remember, those who want to "do things the hard way" and copy signals
by ear and key by hand, could lean to do so with say, ASCII, using FSK
as long as they slowed down to baud rates comparable to what they
currently use with Morse ... they would also gain an advantage of about 6 dB
as has been demonstrated by several of us on several occasions ... plus
they would have, at their disposal a richer character set and the ability to
use the same code with trivially complex machines to operate at MUCH higher
data rates should they need/want to ...

> The important thing for Morse is to try to determine, in an optimal
> manner in the presence of noise, the time lapse between 1/0 transitions.

>
> We also need an adaptive threshold detector that determines the 1/0
> transitions in this AWGN background. We then "time" the no-signal
> interval in an optimal manner using time domain filters.

Neither of you has ever explained (because you can't) how to do a correlator and integrate and dump against the nonexistent energy in the "unvoiced" intervals, how to tell the difference between the real absence of tone and a tone in a deep fade, and a number of other problems that shoot more holes in this farce than a world-class Swiss cheese ...

> To get any better than that, for a better channel capacity, according to
> Shannon's equation, we must increase the transmitted bandwidth, which in
> my opinion is a real bummer for the CW portions of the HF amateur bands.

Baloney ... Morse, with the filter bandwidths commonly employed, comes nowhere close to the Shannon limit ... properly designed digital signals can, and do, provide 100% copy at much higher data transfer rates in the same bandwidths or less ... besides, the OLD idea that "narrower is always" better is, like most ham's knowledge of technology, outdated and passe ... having been replaced over the past 40 years or so in the REAL world by better knowledge and techniques ...

> One thing that is not generally realized is that FSK is only 3 dB better
> than OOK but requires a considerably wider bandwidth.

Horsepuckey ...

> David's idea of optimizing the symbol set in some way may be a good one.
> I am not able to say how we might do that.

Right ... another way to say what you said here might well be "I just can't bring myself to admit that far better coding schemes than Morse exist, so I can't come out and suggest that we abandon Morse and use one of those superior coding schemes ... It's against my religion."

> My main concern is what we have all seen over the years. The so called
> big time high tech improvements turn out, in the end, to be nothing but
> smoke and mirrors, a big pain in the butt.

More "spin-doctor" baloney with no basis in fact ... not worth of further comment ...

Have you thought about using a regular 12/240V sinewave inverter driving a 50V power supply? The inverters are commercially available from 125 Watts up to several Kilowatts here in NZ so you must have access to them over there.
Alternatively, some of the Jap and early Lucas vehicle alternators had external regulators as opposed to the built-in types. You can replace/reset these regulators to achieve other voltages for external supply applications. I ran a S/H 12V alternator successfully at 24V on a field trial by keeping the revs up a bit without blowing the rectifiers. You can expect maybe 80 amps from a car 12V type but for your application have you thought about mounting a truck 24V alternator and doing the same?

You can call Peter Dahl, or you can rewind a pole pig,
or you can maybe get lucky at a swapfest. You could also
try Fair Radio or $urplus $windlers of Nebra$ka.

Besides Dahl (who can fix you up for about $500), you'll
have to search and you'll be spending well into four figures.
I got a note in email yeterday from a gentleman who had
a Harris transformer in that power range, and he said
Harris had quoted him $3K for a replacement.

If "new" is a requirement, call Dahl.

From: Jim <jstrohm@taxes.net>
Message-ID: <3438B0AE.554F@taxes.net>
Source record: 90218

I have a schematic for the Warrior HA-10. Email me
at jstrohm@texas.net and I can snail-mail you a copy.
An IRC or greenstamp in exchange would be nice but
not necessary if your email address ends in .edu .

The Warrior HV plate supply is separate from the other supplies,
so it can be replaced by anything that gives 1500 to 2000 volts
at 0.3 A or more for full output. Higher voltage means more power
out with shorter tube life, and a stiffer supply seems to work better.

My Warrior had a plate transformer from an old Motorola base station
and a home-brew solid-state rectifier stack, and worked fine with
1900 volts idling.

Homebrew hint: you can strip high-voltage caps and diodes from
dead PC power supplies, and build a series/parallel capacitor
bank for next to nothing.

Would height above average terrain have anything to do with this?

# 3326. RFC Value

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-06 00:00:00 UTC
From: Ted Kester <tk1932ga@atl.bellsouth.net>
Message-ID: <34393EB8.3D08@atl.bellsouth.net>
Source record: 90222

I am attempting to build a TRF receiver from an application note that does not have the values listed for the 4 RFC's that are used. The circuit has 4 stages of 2N3904 and a 2N3906 detector. The 04's have RFC's in the collector leads and the 06 has one in the emitter. This receiver is designed to operate around 47 MHZ.

Can somone suggest an appropriate value for these RFC's in uhy or mhy.

Thanks

Ted in Atlanta

Gary is on the right track. In fact, some manufacturers sell you the same cans for 440 or 1.2. I have personally used 440 duplexers on 1.2. In general I've found most of them to be pretty lossy at 1.2 but they do work if you tune carefully.

Source record: 90293

This question references a simple charging circuit from page 56 of the June 1997 CQ magazine. The author claims
that the charging current is limited to about 6 amps by the 0.47 ohm (R1) resistor. Is this a correct value or am I missing
something? If R=E/I, then 12/6= 2 ohms. I have a 12v @ 3A p.s. that I would like to use. If I choose to draw only 2A
then I figure the value of R1 should be 6 ohms, 24W! Could someone please enlighten me..

The "Foxhole Reciver" was made up of two double edge razor blades and
a peice of pencil "lead" the pencil "lead" was and is a graphite
compound. The blades were stuck in a block of wood about an inche apart.
the pencil "lead" is layed across the other sharp edge. A ground wire
is attached to one blade, an antenna (very long) is attached to the
other blade. High IMP (2000 ohms>) earphones are attached across the
blades or in line with the antenna or ground.(which ever works)
This design was a ripoff of the original radio receiver used in the late
1800s and early 1900s "spark days". Where a glass tube was filled with
simiconducting particules of graphite and or iron fileings.
You say you would like to duplicate this technology with todays
technology. OK,..... use a 1N34 diode insted of the razor blades and
the pencil lead.

This type of receiver is similar to yout typical crystal radio and used a Gillette "Blue Blade" as the diode detector instead of a galena crystal. This type of blade was coated (anodized?) with a material that would behave as a diode. A wire whisker or wire wrapped around a pencil lead was used as the point contact. I don't believe this blade has been manufactured for a long time. However, you never know what you might find at an old garage sale :)

Regards,
Rolf

You get an "A+" on your arithmetic, and an "A+" on Ohm's Law, but you
get an "F" on your "Kirchoff''s law. The battery that you are
charging has an e.m.f. of roughly 12.6 to 13.0 volts as it charges.
Your charger has a source or Thevenin voltage of somewhere between
13.5 and 14.5 volts, typically. If you want to design a dissipative
current limiting resistor, you have to use the Difference between the
two voltages, which is only a volt or two in the equation. This is
because the battery voltage and the charger's voltage are in oppostion
to one another. Actaully, such a circuit is not very sophisticated if
it's just using a series resistor as the current limiter.
Unfortunately, I don't have the referenced article to see what they
are using in their circuit.

## 3336. Morse in the 21st century

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-06 00:00:00 UTC
From: s56a@s55tcp.ampr.ORG
Message-ID: <12743@s55tcp.ampr.org>
Source record: 90300

With slight delay I noticed interesting tech debate (again?) on Morse.

I have a great respect for a longtime work of Bill, W0IYH and frequent comments from Gary, KE4ZV but Carl, WA6VSE seems to be of Internet age! I am 52, M. Sc. E.E., computer professional, ham since 1962 on 6-160m using CW, SSB and RTTY. I did Ph.D. resarch on HF CW computer detection until 1991. Let me add few thoughts on the beloved Morse code.

Morse code was introduced 100 years ago as the only form of direct human digital communication and it is impossible to defend in the 21st century. It had efficient entropy information encoding using statistical features of English language by assigning short symbols to the frequent letters.

Morse code has 1:3:5 relation between dots (and element pauses), dashes (character pauses) and word pauses (might be even 7 dots). When hams use hand and electronic keyer to generate code to be received by ears on the other end, dots, element pauses and dashes stay close to 1:1:3 relation but character and especially word pauses are left to the operator's feeling of rythm. Beware of human errors in sending hand Morse which adds to the difficulties of the exact computer decoding.

Endless string of Morse dots with equal length pauses is the fastest CW code produced and we should design our channel filter for that bandwidth. It will not be optimal for real mix of dots, dashes and pauses but the power spectra will be within our bounds and additional dash energy wont hurt much. I intentionally avoid perfect matched filter theme!

Signals in CW On-OffKeying are much easier to detect than NOISY pauses. These are of random nature unless we use complex AI learning algorithms. Even on HF with notorius fading, we have >90% of signals stable within 10msec period so we can accurately estimate optimal threshold for the next signal-to-symbol slice but we are left in the dark during a long pause periods. We can have three 10msec FFT energy samples per dot/pause for a reasonable symbol estimate. Reference length of two dots time is enough for a resolution between dots and dashes, element and character pauses even with poor hand keying. Simple digital median filter of length three easily recovers single bit errors.

DSP CW systems I developed and tested in 1991 could cope with weak HF signals. The only advantage letf was my prior knowledge of the expected information. I stoped further research not wanting to spoil my hobby. I also felt Morse place was preserved in the history as we are the last human generation using it!

Our DC-THz tech guru Matjaz, S53MV, professor at Ljubljana University, claims the following educational advantages of CW in hamradio comms:

QSO procedures, TX/RX protocol, error detection and correction.
Weak side of CW is poor usage of radio spectrum and power (surprised?).
Our ears with associated part of brain are so inferior to visual senses.
The following table sumarises some important radio communications facts:

| Modulation type | Information speed | Bandwidth | Efficiency |
|---|---|---|---|
| Human CW - OOK | 10bps | 500Hz | 0.020bps/Hz |
| Radioteletype | 50bps | 300Hz | 0.167bps/Hz |
| SSB speech | 200bps | 2kHz | 0.100bps/Hz |
| AM speech | 200bps | 6kHz | 0.033bps/Hz |
| FM speech | 200bps | 15kHz | 0.013bps/Hz |
| AFSK/FM packet | 1200bps | 15kHz | 0.080bps/Hz |
| Manchester packet | 38.4kbps | 200kHz | 0.192bps/Hz |
| BPSK packet data | 1.2Mbps | 2MHz | 0.614bps/Hz |
| QPSK GSM mobile phone | 271kbps | 200kHz | 1.355bps/Hz |

Note: Manchester and 1.2Mb packet networks are implemented in Slovenia!

CW EME uses 1kW RF, 20dB antennas, 250Hz RX filter for 5bps and 3dB S/N.
Malfunctioning Galileo probe sends signals from 1000 times greater
distance using only 20W into omnidirectional antenna, RX antenna is 60m,
information speed is 10bps with S/N only 30 times lower! These modern
communication techniques are available to hams (exception is RX antenna)
in the simple form of software, PC and SoundBlaster.

PACTOR2 hamradio modem does 1000bps in 500Hz BW, 100 times more than CW!

I have the following books for sale from a large collection I recently purchased. I will list more soon but if you have needs, wants for a particular book - let me know.

NOTE: ALL PRICES LISTED INCLUDE SHIPPING - LOWER 48

VHF UHF Manual, Fourth Edition 1985, by GR Jessop, G6JP - Hardcover, excellent shape except for a few pen marks on the front cover. Many projects, PC board negatives. Best book of its kind I've ever seen. $25

Radio Handbook, Nineteenth Edition 1975, by William Orr, W6SAI - Harcover. Cover is a bit torn, otherwise in very good condition. Extensive description of antennas. $20

RCA Transistor Manual - 1966 - Softcover - Cover corner bent, otherwise excellent condition. $8

Radio Shack Transistor Substitution Guide, 1974, softcover $3

Radio Shack Understanding Solid State Electronics, 1972, softcover $3 (needs binding)

GE Transistor Manual, 3rd Edition - 1958, Softcover $10

Transistor Circuits and Applications, 1968, Lawrence Cowles, Hardcover with dustjacket. $12 - excellent condition.

SET of 3 RCA Ham Tips. July-August 1954 (Components for Pi-Coupled Amplifiers), Summer 1962 (A 120 Watt 50 MC Transmitter), July 1968 (An Audio Control System for SSB). These are pamphlets and in good condx - some staining, minor tearing. $8

Principles and Practices of Radio Servicing, 2nd Edition 1943 - HJ Hicks. Hardcover text type book. Very Good condx. $15

ARRL Handbook - 1952 - Cover complete but needs binding. Good condx with a few bent page corners. $20

ARRL Handbook - 1965 - Excellent Condx. inside cover page which has been separated from the binding. $18

ARRL Handbook - 1974 - Very Good condx. Cover a bit worn with minor bends. $12

RCA Transmitting Tubes Technical Manual TT-4 - 1956 - Excellent Shape. Cover has a little wear. Looks like it was never opened. Softcover - $10.

Many more available - particularly for broadcast television.

NOTE: Satisfaction Guaranteed. You don't like it, send the book back I'll refund the purchase price minus the cost of shipping.

ALSO: 10% Discount for current FISTS, QCWA and OOTC Members. Only one 10% discount applies. Buy several books and we'll talk about price.

PRICES INCLUDE SHIPPING. Prefer US Postal Money Order. Checks will be held 2 weeks to clear.

Contact me with any questions.

Not true!

The problem that we face regarding CW operation is this:

1) We all recognize that CW is not, technically speaking, a method of the greatest efficiency. My critics just refuse to let me alone on that subject. I get tired of hearing it.

2) But there are other factors involved that we insist on ignoring, in our enthusiasm for technical perfection as the only issue that is allowed to be considered (it is politically correct, right?).

3) In amateur bands where spectrum space is not a critical issue, the more efficient data modes are certainly preferable. No one is arguing about that. I know the numbers as well as anyone.

4) The problem lies in the HF CW bands, which are narrow and are often crowded, especially during contests and during DXing activities. There are some who have a certain disdain for these activities, but I couldn't care less about that. For example the 20 meter CW band is only 100 kHz wide, and half of that is occupied by data stations (which is OK).

5) In this scenario, it is vitally important to restrict bandwidth as much as possible, just simply because it is a precious commodity. Let me give you an example of what I mean. At one time there was a very similar rather strident and noisy and opinionated group who promoted Double-Sideband-Suppressed-Carrier speech, because it offers a 3 dB S/N advantage over SSB. In just a very short time it was realized that the narrower bandwidth of SSB was a greater benefit because of the crowded HF bands and also because it was easier to receive (phase coherent detection not needed). Since that decision was made there has been very little looking back, at least as far as the HF ham bands are concerned.

6) We have the same situation now, people who don't want to look at both sides of the issue. The simple conclusion that is very easy to recognize is that for the ***HF CW BANDS*** CW mode using Morse is still, and will continue to be, a sensible and efficient mode, if it is done correctly.

7) The point that I and several others have tried to make is that narrowband Morse code, properly implemented with computer-assisted coding and decoding (in a noise and interference environment) is still an excellent mode for Amateur communication, despite its theoretical limitations. In a crowded and fading spectrum it begins to look a hell of a lot better than the introductory-level textbook number crunchers give it credit for.

8) The approach that I and others are advocating is to **OPTIMIZE** Morse code usage as a desirable alternative to eliminating it, for the very precise reason that in the crowded HF CW bands it makes a lot more sense than the wider bandwidth alternatives. If you listen on 20 meters or on the commercial/military frequencies you find that a data station takes up much more spectrum than a CW station. This illustrates the problem very clearly. A high speed data stations completes a message faster, but creates wideband interference. A CW station takes longer but creates less interference. The wideband interference is a greater problem, in practice.

9) There are those who have examined the bit error rate vs S/N ratios of the various waveforms and have made up their minds, no arguments allowed. Numbers are numbers, right? Wrong! What I am telling you is that this is not good engineering or good science unless it also considers the realities of the *channel* and the *spectrum* that is being used for communication. The *real* experts deal with these realities every day of the week. The simplistic answer is to ignore all of these bothersome details.

Bill W0IYH

> BTW, we have a good deal on Russian 807's
> if anyone's interested. Check out:
> http://www.triodeel.com/tubes.htm

Ned,

Consumer electronics is one of the few things to actually decline in price based on the operative CPI. That National HRO actually sold for about $2,200 in today's dollars. The SX-88 of the 1954 era aold for about $4,000 in today's dollars and a KWS-1 - 75A4 combination sold for about $9,000 in today's dollars.

A good rule of thumb when calculating in constant dollars is... 1946 - 1950 multiply by 6.5 1951 - 1955 multiply by 6 1956 - 1963 multiply by 5
This will get you in the ballpark.

In article <12743@s55tcp.ampr.org>, S56A@s55tcp.ampr.org wrote:

Since I am only interested DX operating, my opinion will be rather biased. However, I am certain that in the midst of extreme interference like one would find in a pileup (thinking along the lines of the 1978 Clipperton expedition, the worst I can remember) CW reigns supreme. That is why I was able as teenager to work all that rare DX using 100W and a dipole. Or work China on CW in early 80's using indoor antenna and 100W :) SSB was always a bust- only did well when I went over to visit friend with KW and monobander.

Lastly, I used to do a lot of work with power line carrier products, for using the AC power lines for remote control. In that case, the debate was between FSK and ASK, although Japanese company was trying spread spectrum. The AC power lines have to be one of the most grueling environments for transmitting data. I guess CW is a form of ASK.

Rob.

ps. one thing I wonder about all these advanced modes: Do they put the operators' brain so far removed from the ether that they are just no fun? I always thought that the difficulty of the simpler modes was what made them interesting. Really, if we are left with digital modes using a keyboard and crt, then I may as well just use the Internet.

# 3341. WTB: Weak or Dead High Power Tranmitting Tubes

I'm looking weak or dead high power transmitting tubes. Tell me what you have available.

Principally looking for tubes with >100 and <50,000 watts plate dissipation that will work (used to work) at full rating up through 144 Mhz.

-Jim

I do not remember, if I have previously reported these experiments in some newsgroups, so someone may have seen this before.

I have been playing around with an old DSPlay DSP simulation package and constructed some matched filters using FIRs with coefficients +1 for mark and -1 for space clocked with 2 or 3 times the dot frequency. Each character included the character itself and the intercharacter space. Since the taps must be in reverse order, the taps for "A" were

0,0,...,0,-1,-1,-1,-1,-1,-1,1,1,1,1,1,1,-1,-1,1,1,-1,-1,-1,-1,-1,-1,0,0..

After each filter, the output was normalized to compensate to different lengths of filters. Running a noise free unipolar (0,1) Morse signal (simulating A1A modulation) containing the word "PARIS " in parallel to all these filters, the "P" filter had a peak early, followed by the "A" filter and so on. However, the 2nd and 3rd highest peaks from each filter were within only a few dBs from the strongest peak for short characters. For a practical decoder the output from each (normalized) matched filter output would have to be compared to find out which is the strongest and that it is above a threshold value. I also made a matched filter to match the entire word "PARIS " and it displayed a single very strong peak (as expected) and a few much weaker one.

However, adding gaussian noise to the input signal degraded the results very rapidly causing false peaks from the matched filters. Switching to bipolar signal (-0.5, +0.5) (simulating FSK) improved the situation somewhat. The test setup was not very realistic, since both the intended signal and gaussian noise were not band limited and only two samples/dot time were used.

My main interest was to study parallel decoding, but the most remarkable observation was the relatively strong side-peaks for short characters even with noise free signal. For longer characters, the main peak to side-peak ratio at the matched filter output was quite good in some cases and even better when decoding a whole phrase, as the example with decoding the word "PARIS " shows. The "PARIS " filter gave a nice peak with bipolar input, when the outputs from individual character filters were completely useless due to the added noise.

Ned,

I can not disagree with anything you say. Yes you would have to take into account the tube vs solid state construction as well as the economies of scale with mass production techniques. As you say, those National receivrs were virtually hand crafted. However, industry was geared up to produce the tubes, tuning caps, and bandswitches which have been technologically outmoded today. With the Marantz and the Dynakit, there is no one producing parts to any large extent. Small runs mean high prices. If the

transister or IC were never invented it would be interesting to see if electronics would have in fact decreased in price in terms of todsy's dollars.

On the other hand, automobile production has been automated to a large extent. I did a little research today on the cost of a Chevy 4 door full size sedan in 1951, and it was about $1,800.
If the CPI held true, that should be about $10,400 today. The full size Caprice, last I looked, sold for about $22,000, or twice the rate of the CPI. of course there is more equipment and light year ahead technology in it. A house is another interesting example. My house new sold for about $12,000 in 1958. not it appraises at 13 times that amount. New construction for the same size home costs even more. Take a look at health and auto insurance costs from the same time period, or the costs of a college education. Maybe the CPI has been misfigured all these years on the low side?

> Is there a standard all-weather response to these two specifications?

I. I.-

If the crystal can be tuned across several KHz, it is probably operating in parallel resonance mode. It might have a varicap diode (voltage-variable capacitor) or a real variable capacitor, to effect its frequency change.

If this is the case, then exact frequency and load capacitance may not be critical. In other words, you may be able to use the cheapest crystal available. You might specify something like parallel resonance, 24pf load capacitance, 0.01% tolerance.

If this isn't the case, and the crystal operates on a single, precise frequency, then all bets are off.

I think you can get what you want if you talk to someone at the crystal factory. In years past, I've ordered from Sentry and International, and the people taking the orders knew what I wanted better than I did! They may already be familiar with that specific QRP Kit's requirements.

Bill Sloman's response is correct. It is common for manufacturers to get requests from their customers for a "more loosely specified" product (or a "more tightly specified" one). If the manufacturer then determines that there is enough business for cuch a device, they will generally introduce it with a slightly differernt part number. This is the case with the NE602/612 and the NE604/614.

The NE602/604 were the original products and were designed mostly for the cellular phone market. A customer requested a lower price with more relaxed specifications and Signetics marketing did a market study and found that there was a need for lower priced, relaxed specifications and introduced the NE612/614. The testing eliminated means that the cost of manufacturing was lower and that cost was passed on to the customers who did not need the tighter specifications. The die for the NE612 is the same as the die for the NE602; the only hdifference is in the the testing. The "A" version is an improved die.

(I was there when these parts were intriduced).

>Allso if the supplies have Max current limiters go ahead and parallel
>them as the worst that can happen is one will go to max outpiut and
>the other will pick up the remainder of the current.

Also, check if the supply has a "remote" input on the back. Some
supplies are designed to be operated in parallel or series.

The way this works is this: Normally, the error amplifier in one
supply drives the output stage in that supply. If it is a constant-voltage
and constant-current supply, there are two error amplifiers, and whichever
one wants the *least* output drive wins. But in either case, there
is a point in the circuit that represents the drive to the output
supply.

In a supply intended for parallel operation, this point is brought out
to the rear panel. Normally, the output of the error amplifier is just
jumpered to the input of the output stage. But you can break that
connection, and instead connect the output stage to the error amplifier
output of *another* identical supply. Then the one supply acts as
a "master", with its current and voltage controls setting the maximum
output of the paralleled supply. The second supply is a "slave", just
supplying extra current under the control of the master supply. Since
two nominally-identical output stages are being driven with the same
signal, each supplies about half the total output current.

> Several persons have tried to judge the information to learn any
>possible difference.

The difference between the NE/SA602A and the NE/SA612A is that the
data sheet for the former specifies maximum values for noise figure at
455kHz, third order intercept point and RF input capacitance.

All of these will make the former part more expensive to manufacture,
because guaranteed maximum values have to be tested, which costs money,
and parts that don't meet the spec have to thrown out, or (in this case)
shipped as NE/SA612A parts.

The difference between the NE/SA604A and the NE/SA614A is much the
same, except that here we have to look at the tightness of the tolerances
on the parts - the NE604A is more tightly toleranced than the SA604A
which is in turn more tightly toleranced than the NE614A.

These sorts of diferences may seem trivial, but anybody who had worked
with tightly toleranced designs would be aware of the economic
importance of predictable performance from the IC's.

What is the Norwegian for "cowboy"?

I think 100V spikes would be getting extreme for a 12V type alternator.
Right or wrong, I worked on a rough rule of thumb that spikes may be 2.5
times the o/p voltage. Having said that, I have never actually had one pop
on me and we did (accidentally) run the alternator off-load to near 50V
briefly on testing when attempting to get the regulator correct. Maybe a
quick phone call to a friendly Auto-electrician? Hopefully you have a
nearby friendly car wrecker with reasonable prices? Best of Luck!

I went to the James Watt Memorial College in Greenock to learn my morse code (is it still there?). Then I spent many happy years wandering the globe communicating by hand morse for a living. I used long and short codes, Q Codes and learned out of sheer desperation the right way to send v-v-vs to catch those sweep Russian transmitters in the Arctic. When I settled here, I ended up conducting morse code examinations for amateurs. I finally escaped from its pull but now I hear morse code in the wind, in a squeaking door, and I would swear Sam the family pet Cockatiel sings in morse code. I do not think morse code will die for me but I have no scientific confidence for this belief, just a contented prejudice.

Other modes may be more efficient, but when you add up the simplicity of equipment required, cost, operator skill etc, Morse has a lot in its favour.

I've just finished building a direct conversion CW transceiver for 40 & 20m. It puts out about 5 watts and uses a VXO and freq doubler to cover the bottom 20 kHz of 40m and the bottom 40 kHz of 40m.

Got it on the air last night. First QSO on 20m was a local (15km away). Then had a few interstate QSOs on 40m. Then back to 20m - worked BV, HL, ZL and VK6 with just a dipole antenna. So it looks as if it works and is a good DX performer.

It will certainly not be much good for passing commercial traffic - computers and satellites are best for that, but on the basis of cost, simplicity and sheer fun of building and operating it, it's unbeatable. As a hobby we can use a range of techniques - some (many) are not state of the art, but we use them anyway. Our objective as hams has nothing to do with making money, so I for one will continue to build gear for this obsolete mode until someone comes up with a mode easier/cheaper to construct equipment for.

## 3357. Crystal Radio Problems and Insights

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-07 00:00:00 UTC
From: lordclump@aol.com
Message-ID: <19971007100401.GAA12800@ladder02.news.aol.com>
Source record: 90231

When I was a kid I had great fun playing with crystal radios, and thought I knew pretty much how they work. So the other day I bought the Smithsonian "SmartLabs" crystal radio set for my kid and put it together, but it didn't work. My favorite station back when I was young was KFI 640, which came in nice and strong with the simple wire antenna strung along the house in Orange County. Now I live in Los Angeles County so I thought since I'm even closer to the transmitter it should come in even stronger. But when I hooked up the radio, all I get is KNX 1070 -- regardless of how I tune the capacitor or even if I remove the variable capacitor entirely. Suspecting a faulty capacitor, I went and bought an identical crystal set but it also failed to tune in any other stations. This radio has a simple single-wound coil consisting of a wire wrapped about a hundred times around a plastic tube. I remembered from before that there are two ways to tune the crystal radio: one uses a fixed coil and variable capacitor, and the other uses a fixed capacitor and variable coil (both types worked when I was a kid). I constructed a new crystal set from scratch and wound my own coil and sanded off a strip to use for tuning. This radio acted as if it tuned better than the other because as the contact moved along the coil the reception peaked and then faded; but I was still not able to tune in any other station.

On a whim, I went to Radio Shack and bought the crystal radio they had, called "Science Fair". This set has a variable capacitor with a complex double-wound coil with a soft iron core. When I put together this radio I was suddenly able to tune different frequencies, but the only frequency with any detectable signal was once again 1070. Thinking that a longer antenna would help pick up the lower frequency, I replaced the 40 foot antenna with an 80 foot long wire, but this resulted in no improvement. Resigned to the realization that one station is all I will ever be able to get, I turned my attention to antenna design. I always thought how inconvenient it was to string up this long fixed wire all over the place for an antenna and then find a water pipe, scrape bare metal and attach a wire for a ground. Why not use a loop antenna to capture the magnetic field instead of a wire to capture the electric field?

I had an old piece of quarter inch wood doweling so I notched it up into an X and wound up a simple loop antenna with some thick magnet wire. To my surprise it worked by picking up the 1070 signal, but weaker than the wire antenna and ground. So I figured that the greater the cross-section and the more the windings, the better the antenna. Then I bought two 36" dowels and notched up a larger X and wound it with some fine magnet wire, 24 loops. When I hooked it up I expected either better or the same; instead I got almost nothing at all. I figured the impedance was too high for the coil or something. But I knew the loop worked with the small antenna so I measured the length of wire in each -- 35 ft for the

small one and 200 for the big loop. I knew that for a straight wire antenna you want 85 to 100 feet, so I took out 12 loops. When I first hooked it up I was glad to find the 1070 station at last, coming in quite strong. After fiddling with the different coil inputs and the tuning capacitor and maximizing the signal by orienting the rectangular loop just right, I was barely able to pick up the 640 station that I had been questing after for so long. (I also get KABC 790 even fainter, yet still understandable).

I searched this newsgroup and the web for loop antenna information. Some people said that the twisted pair of leads coming off the loop into your set act as mini straight antennas that disrupt the signal and one should use shielded coax cable. Anticipating even better reception, I cut into the antenna, removed the twisted leads and soldered on a coax cable. When I connected it to the radio my hopes were dashed with confusion because the signal was much weaker. So I cut into the wires again to reconnect the twisted pair.

All this time of fiddling with antennas, another queer thing kept happening: the Radio Shack radio would quite often simply stop making sound -- either by fading out or by suddenly clicking off. Sometimes as I reached toward the connections it would suddenly start working again. Other times I would wiggle all the connections to make sure contact is being made, but nothing happens to make it work. I checked the first crystal radio (with the simple coil), but it always played 1070 regardless (and by the way never worked with the loop antennas). So after replacing the capacitor to no avail, I suspected a defective coil. Once again I bought another crystal radio, but the same darned thing kept happening. By chance (or my constant fiddling) I discovered that if I place a charge across the tuning coil (with a single AA battery) it kicked the coil's butt into operation and everything was fine for a long time until it needed to be shocked into shape again.

Another aspect of the radio that seemed to bother me was that the diode only passes half the current; now I hate to waste anything, especially if it is free, so I wanted to capture both the positive and negative swings of the circuit's cycle. Immediately I built a diode bridge (such as one I built in college lab to rectify AC current to a DC power supply) using four diodes to connect the tuned circuit signal with the earphone. It didn't get any louder! I was disappointed because my station reception is so faint. Then while fiddling with the diode connections in my mind, I thought why not simply rectify the reverse current through a separate resistance instead of the same resistance (earphone) as the forward current. So with two diodes and two earphones I could effectively double the output (but it is still no louder).

For those of you electronics experts who have followed my story this far, I offer the following questions:
1) Why can't I get more than one station? Is the transmitting antenna for 1070 so close to me it drowns out the others? Is the small hill I live behind that gives me poor TV reception also blocking the AM

radio waves?
2) Why does the simple single coil do so poorly while the iron-core
double coil tunes better?
3) Why does the iron-core coil radio switch off and on?
4) Why did the coax cable fail?
5) Why can't I use diodes to get more volume from one earphone?

Some time ago Ulrich Rohde published some circuits of mixers made out of an array of switched amplifiers, each one being one of the transformer-feedback bipolar transistor type. His published results were quite good.

> The main benefit using of 7360 in mixer configuration is from fact
> that it always works while being in it's most LINEAR range - 100% of
> time!
>

You seem to be making the assumption that the switching process of the beam deflection tube does not affect the linearity of the beam modulation process. This will not be strictly true if any of the deflection field has any influence on the electron gun region. Also, the electron beam modulation by the incoming signal will not be perfectly linear, any more than we could make perfectly linear triodes, tetrodes, pentodes etc.

The 7360 was certainly excellent, but it was not perfect. I have wondered about making a double balanced mixer with a pair of matched 7360 tubes....

> On contrary - almost all other devices used in mixers circuits
> are driven from its best linearity point (at least - for a little
> fraction of time) by heterodyne and much smaller interferences can
> distort
> useful signal at these moments. No matter what devices are used -
> linearised or not, bipolars, FET's, or tubes, no matter - how many
> gates or grids are used for mixing. All they are in NONLINEAR region
> at these moments!

Consider the transistor tree mixer such as the Plessey SL6440 or Motorola MC1648/MC1496 families. The signal applied to the "tail" transistor is amplified in a device which is 110% of the time biassed into its most linear region, the signal current it produces is diverted by the transistor pair above it - this resembles the beam deflector of the 7360 very closely. However, their performance is not in the league of the 7360, nor of the latest crop of switch-mode FET mixers.

Structurally, the 7360 was far ahead of its time, and the actual power level it was capable of running gave it the advantages of brute force, too. Together these advantages made an outstanding mixer. At a time when most receivers (though there were a couple of honourable exceptions) had mixers with third order intercept points in the 0dBm region, the 7360 was in the over +30dBm class (I made one and measured it about 15 years ago)

It has taken many years, but semiconductor mixer technology has finally caught up.

> 7360 uses beam deflection for heterodyning - this doesn't act on
> linearity.

There is a small effect of the seflection fields in the electron gun area that does have a small effect on the linearity of the modulation of the electron beam, giving some non-linearity due to the oscillator signal, and the modulator itself has its own non-linearity problems. It is not perfect, but until fairly recently, it was the best.

> And if you like brute force - 4CX250 (four pieces) in double balanced
> configuration is the best solution...
>

This isn't really a beam deflection approach, it's a tree mixer, I suppose. Beware that the 4CX250 was designed entirely for AM class C and FM use, its linearity is poor compared to tubes designed for linear operation.
With the amount of brute force possible, of course, the result would still be extremely good, though a more linear triode of comparable power could be even better.

> Xcuse - if I was speaking abt well-known things. I just pointed to one
> aspect

It's an area I've had a long term amateur interest in, and I've also been involved professionally in extremely linear receiver structures for measuring equipment. I'm enjoying the discussion immensely!

Why not try the HT transformer out of a junked micro wave? Two in series
should do the trick or use two parallel with a doubler circuit.

Just a thought - at least it's cheap!

I really think that many of us are not aware of the *real* agenda in this discussion of Morse CW vs other modes. These other modes are presently available to anyone who wants to experiment with and use them. Or, STAs from FCC are available.

The name of the game is "control", where a certain small but strident and militant group is not satisfied to do what they want to do, they want to tell everyone else what to do. And anyone who doesn't want to fall into line is subjected to ridicule and name calling, such as "fanatic", "stick in the mud", "old fart" and so forth, and is subjected to other curmudgeonly behavior. The buzz word for them is "educate". They are going to educate the ignorant mob.

Sociologists are well aware of the dynamics of the "clique" group, and its relationships with "outsiders" and "non-believers". This is a classic example, right out of the textbooks. The rationale is one thing, but the real game is something else.

For equal values of average sideband power or for equal values of PEP,
and for ordinary speech with no sharp peaks (Hilbert transform peaks)
the signal power to noise **DENSITY** ratios are the same. But since
DSBSC has twice the bandwidth, the total noise is 3 dB greater for
DSBSC.

My two cents on this thread.

I am a strong advocate of the preservation of Morse. I believe there is NO technical or socio/political justification for it. However, there is no technical or socio/political justification for use of HF.

I believe removal of the code requirement is inevitable.

I would like to see sub-bands preserved for Morse only. Preferable the lowest 10 kHz of each HF ham band or even the guard band below it. Power would be limited to 5 W or some other small power. A special class of license which requires a code test would be needed to operate in these bands. 5 wpm would be adequate with a strong enough technical test to ensure understanding of the band's rules. Morse at full band power would be allowed in any other digital sub-band. No test would be needed for this as it would be self testing in use. If a person's code was bad enough, no-one would answer him or her and they would give up using it.

Garth,
I don't bother playing with junkyard dogs, I've purchased several 'new'
Leece Neville units and imported them direct from the US. I kinda know
what I'm buying.
I'll open up a 160A unit up and check out the diodes to see if I can
change them easy enough and also sit down and design a 50V regulator.
Head scratching time.
I gather this modded unit will give me around 40A at 50V, yes or no?
My proposed battery bank will total 210A at 50V (4 X 210A 12V deep cycle
units), and with typical amateur duty cycle I'm wondering if this will
be enough to keep my batteries charged.
I have full digital monitoring of V and I drain on my entire mobile
system. On full chat I'll be peaking around 10KW for 5-6KW pep o/p.

Phil G4ZOW/M

The above is of course total fiction, as with all my amplifiers, they
are only ever driven to our legal output level of 400w.

> which does not depend upon a man-made infrastructure.

I believe that I should have said: "There is no technical or socio/political justification for use of HF with the possible exception of back-up to the current infrastructure. In this role, it is not particularly reliable."

As an aid to reliability, the US Navy and Army Signal Corps had a series of relay sites throught the world with high power transmitters (ca. 250 kW) and multicurtain rhombic antennas operating with dual diversity. Even then, the availablility point-to-point was only on the order of 85% because of solar activity being able to disable any particular link.

Within 5 to 10 years systems like Iridium and Teledesic will eliminate this advantage. When these systems are on line, the individual will be able to communicate point-to-point anywhere on the globe reliably at an afordable rate.

Using the justification that Morse is an obsolete means of communications...therefore everybody should be allowed to use HF is a conflict in terms. Obsolecence is not justification for opening HF without CW. They both are obsolete.

I believe that there is a reduction in use of the bands in CW. I believe that the cost of getting on the air on CW is no longer an order of magnitude less than getting on the air on 'phone. I believe that digital interfaces to computers are reducing in cost. These are good reasons for opening up at least a large portion of the bands to non-code licensees.

Nevertheless, I believe that all of my reasons which affect the need for a code requirement may be a factor in increasing the advantage of the "have nations" over the "have not nations" and this should be considered before eliminating the code requirement entirely.

For most amateur constructed circuits an xtal below 20MHz is paralell
mode, and above 20MHz is overtone mode (series resonnance).
Parallell mode xtals will tune the correct frequency with a certain
load capacitance, somebody claim that 30pF is normal, other believe
25 pF to be normal. Old Kenwood sets (TR-2200) need 40pF xtal
specifications to operate on correct frequency.
Drake and Collins rigs and other uses fundamental series mode xtals on
all HF ranges.
Normal is a specification of zero pF, but again somebody mixes up the
30pF loading capacitance to be valid for either series and parallell
resonnance. This is a bad problem, I have seen many German circuits

where the authors thinks it is normal to have 30pF loaded overtone xtal, in my opinion it is a strange practice. Commercial rigs has a rather varied practice, and the best idea is to send a copy of the circuit diagram to the xtal manufacturer when ordering xtals

snip, snip.

I have just finished a session of replying to these comments, and I find that I am just repeating everything over and over, like a tape machine. It just isn't worth it any more. If you want to put direct sequence or frequency hop or PSK on the low end of the 20 meter band because it is more "efficient", go ahead.

I want nothing more to do with this. All I hear is that the higher efficiency of wider bandwidth is all that matters. All that matters is the revolution in communications that imitates what the military and commercial people are doing. Whether it makes any sense for Amateur Radio or not is immaterial. So be it, then.

However, if they're described as "crystal earphones", you will need to put a high value resistor (220 or 470 k) across them to provide a DC path to ground.

Speaking for myself, my objection to some arguments advanced in these newsgroups is that some have overstated the technical capabilities of CW. Whatever the other merits of CW may be, it's not state-of-the-art by any stretch.

> 3) In amateur bands where spectrum space is not a critical issue, the
> more efficient data modes are certainly preferable. No one is arguing
> about that. I know the numbers as well as anyone.

I suggest that efficiency is even more of a concern where spectrum *is* tight.

> 4) The problem lies in the HF CW bands, which are narrow and are often
> crowded, especially during contests and during DXing activities. There

> wide, and half of that is occupied by data stations (which is OK).
>
> 5) In this scenario, it is vitally important to restrict bandwidth as
> much as possible, just simply because it is a precious commodity.

A modern spectrum manager would say that it is vital to *reuse spectrum* as much as possible. While occupied bandwidth is one component of spectrum reuse, it's not the only one, and focusing exclusively on bandwidth minimization is a simplistic -- and often wrong -- approach. Costas showed in 1957 (if memory serves) that spectrum use is maximized by use of *wideband* signals (properly done, of course), and the math hasn't changed since then. That's not to say that we should all rush to wideband systems. Other factors come into play. But the idea that CW will pack the most communications into the least spectrum overlooks the time and power factors. More about that later.

Of course, the dominant characteristic of the "HF CW bands" is the presence of CW signals. If the goal is to pack the most CW signals into the band, that's one thing. But if the goal is to maximize the amount of communication that can be performed in the same spectrum, there are better techniques. That's not to say we should rush to use those techniques because absolute maximum spectrum use is not our primary goal.

> little looking back, at least as far as the HF ham bands are
> concerned.

Sure, but who's talking about a mere 3-dB improvement and a doubling of bandwidth? The ineffectiveness of DSSC, considering the bandwidth increase, says nothing about the effectiveness of other techniques. They have to be independently analyzed.

> 6) We have the same situation now, people who don't want to look at both

> is that for the ***HF CW BANDS*** CW mode using Morse is still, and will
> continue to be, a sensible and efficient mode, if it is done
> correctly.

I don't want to dissuade anyone from using Morse. It's fun -- I like it myself. I just dislike seeing it touted as state-of-the-art; it's not.

> 7) The point that I and several others have tried to make is that
> narrowband Morse code, properly implemented with computer-assisted

> of a lot better than the introductory-level textbook number crunchers
> give it credit for.

This, leaves me nonplused. Computer-assisted Morse? What's the point of that? Once you introduce a computer into the equipment mix, why not go ahead and use it to optimize the communications? And that will inevitably mean using a coding other than Morse.

> 8) The approach that I and others are advocating is to **OPTIMIZE**

> problem very clearly. A high speed data stations completes a message
> faster, but creates wideband interference. A CW station takes longer but
> creates less interference. The wideband interference is a greater
> problem, in practice.

You're making an assumption that "data" implies "high speed." The issue here is the optimal use of spectrum. That is accomplished by using the smallest product of bandwidth, time and RF domain. That product can be optimized at any speed, not just high speeds. Clover, for example, fits

in a 500-Hz bandwidth, a value which was chosen to match the commonly available IF bandwidth, while providing data rates of hundreds of bits/s. Contrast this to some of the data transmissions outside the amateur bands that occupy several kHz and provide greater data rates.

All else being equal, if a data station transfers the desired communication in far less time than the CW station but using slightly more bandwidth, the overall capacity of the spectrum is greater -- more stations can transfer more information in a given period. Or if the data station occupied the same spectrum as the Morse station and transferred data at the same rate, but required considerably less power, the spectrum capacity would again be improved due to the lower level of interference caused by the data station. You have to consider *all* of these factors when analyzing spectrum use.

> 9) There are those who have examined the bit error rate vs S/N ratios of
> the various waveforms and have made up their minds, no arguments
> allowed. Numbers are numbers, right?

It's not as simple as BER versus S/N, no. But neither is it as simple as "use the minimum possible bandwidth." When you start to fold in the effects of Rayleigh/Rician fading, intersymbol interference, non-Gaussian noise and interference, the advantages of using advanced digital techniques actually increase, not only with respect to a particular communication link but also with respect to spectrum capacity as a whole. At that point, yes, numbers are numbers.

> Wrong! What I am telling you is
> that this is not good engineering or good science unless it also
> considers the realities of the *channel* and the *spectrum* that is
> being used for communication.

That's why the modern communications engineer deploys modern tools to combat these realities.

> The *real* experts deal with these
> realities every day of the week. The simplistic answer is to ignore all
> of these bothersome details.

What "real experts" do you mean? Can you identify them? One identifiable group of "real experts" consists of those who earn their daily bread by deploying HF communication systems. Since these professionals have virtually eliminated Morse as an operating mode in every other service, I'm struggling to figure out what experts you could be referring to. Who in the professional world is deploying new Morse systems to combat the realities of channel perturbations and spectrum crowding?

>Just a thought - at least it's cheap!

You shouldn't series connect them, one end of the high voltage winding is connected to the core/frame/chassis and by stacking them up you may be taking the primary winding insulation to places where it was not meant to go.

They normally run as half wave doublers, the second diode being the magnetron itself. So paralleling them sounds like a ok idea. And if you could reverse the primary phase of one of them, you should be able to reduce the ripple.

They often have a magnetic shunt to act as current limiter, (a block of laminations that fills the winding holes in the core, between the primary and secondary), but this may be able to be knocked out if the load is well behaved, or left in for safety's sake.

Those of you who love to quote information transfer rates using various communications modes are missing a very important point:

Ham Radio is only a hobby.

Folks, even long after the industrial revolution has effectively rendered horses obsolete for most transportation needs, we still see lots of folks riding horses. Why? Because it's fun. Sure, one could make the argument that there are places you can go where a horse is still the ideal mode of transportation. But those places are fewer and fewer in number.

Likewise, Morse Code adherents are always saying that it can do what no other digital mode can. Yes, there are situations where Morse Code is still appropriate, but those are fewer and fewer in number every day. That issue is irrelevant, however, because the biggest reason one might still use Morse Code is because it's fun.

Having said that, allow me to point out that we don't ask people applying for a driver's license to prove they can ride horses. Likewise, we should not be asking folks who apply for a ham radio license to prove they can receive Morse Code.

I still enjoy using Morse Code from time to time. It's fun in the same way as riding a horse is fun. Sure you could go faster, use less power, be more spectrally efficient and so on. But this isn't a business. If you're not having fun with this hobby, then why are you doing it?

P. S.: Those of you who argue "this is a service, not a hobby" are missing another thing: The FCC classifies us as a service only because as hobbyists, we are also performing a valuable educational service. This should not obscure the fact that not only are we doing this for free, we actually spend a great deal of money and time for the privilege of holding a license. Again, if it isn't fun, then why put out all that effort for free?

Many of us would have more fun and be able to contribute a lot more
if we had access to the HF bands for *our* interests ... experimentation
and design of new modes and equipment for those bands ... (NOT, as
some pro-coders insist, so we could "grab a mike and scream CW DX!")

> P. S.: Those of you who argue "this is a service, not a hobby" are
> missing another thing: The FCC classifies us as a service only

The educational/self-teaching side has atrophied seriously over the
years ... and needs major rejuvenation ... as does the expermentation
and advancement of the SOTA part ... *those* things are more fun to
many of us than getting a silly (to us) piece of paper that says "DXCC"
on it ... and Morse is no fun at all for many of us .. so, using your
argument, why should anyone HAVE to "do Morse" ???

> This should not obscure the fact that not only are we doing

>mag features these for HV power supplies.
...snip

First of all, I seriously doubt that a Microwave Oven Power
transformer would be capable of 2000 volt-amperes. It would weigh as
much as my legal limit amplifiers. I suppose they do make MW ovens
that big, but the one in my kitchen is around 500 watts, and that
sure won't do it.

Almost every legal limit amplifier in the country - AL-800H, Henry 2K,
and many others, will have a power transformer rated at 3000 to 4000
volts and capable of supplying 1/2 amp steady state. So why don't you
just call up Ameritron and tell them you blew the transformer in your
Model _____( you fill in the blank), and that you want to buy a
replacement?

Bob

P.S. Peter Dahl's transformers are good - no question about it.
However, the one in my Henry 2K weighs a ton - I can't lift the power
supply unit more that 6" of the deck without help. The entire AL-800H
is light as a feather by comparison. The Peter Dahl runs as cool as
ice. Think it might be over-designed?

So what does anyone think of using a DC-DC converter section out of a
mobile audio amp. I worked on a one for a friend and it put out about 3
amps at +-50V. A blown up audio amp might be a great source of parts
and boards.

Hello Ted,

The formula is X= 2pi * F * L.

At 47 MHz, that yields 6.28 * 47 * 10^6 or roughly 300 ohms per
MicroHenry. If you think the inductive reactance of j300 will be
enough of a choke for the circuit, then go with 1 microhenry, etc. Be
advised however that there are many different types of RFC's,
depending on how much distributed capacitance you can accept, the
resonant frequency of the choke, etc.

Look in the Newark Electronics Catalog on p 136. They have
Mil-C-15305 Molded inductors in sizes from 0.1 microH to 1000 microH
They are about the size of 1/4 to 1/2 watt resistors.

Thanks to all who replied to my request for Soundblaster details.
Perhaps I should have been more specific. I write programs for hams, one
of which is a Morse tutor, so thank you to suggestions of getting
Supermorse, not really what I want! Connecting the SoundBlaster to the
internal speaker drive is also not what I need. If anyone is interested
my software is at <kay-dee.demon.co.uk>. There is a very clever CW
program on the Demon ftp site (ftp.demon.co.uk in the /pub/ham/cw
directory) called pileup.exe which emulates a pile up (surprise!), I
don't know who the author is but my hat off to him.

People speak of the advantages of the higher data rates per kilohertz
that are possible, but they miss the main point - What's the higher
bandwidth going to be used for? A bit like having sufficient bandwidth
for 500 TV channels, but finding that it's just 500 channels of rubbish.

I don't think I need any more bandwidth than standard CW provides to call
"CQ contest"!

A computer-assisted adjunct to manual or clocked (electronic keyer) CW operations that would enhance weak-signal and QRM situations would be a desirable way to *reduce* the inherent deficiencies of CW, without relinquishing the narrow bandwidth and the wide acceptance of and interest in the CW mode. It's a compromise.

>measure the time between "signal" transitions.

Indeed, that's what we *have* to do with OOK. But note that this is
part of the *decoding* problem, and not the demodulation problem.
We still have to make a slice decision before we can start to time this
interval. That's where we do demodulation, and that's where matched
filtering of the signal would give us the best slice margin, IE the best
SNR.

We can't do that for the unvoiced symbols, and we can't do it for
the voiced symbols either (because we can't know that we are receiving
a dot or a dash until after slicing, and their spectrums are different so
they'd require a different matched channel filter). All we *can* do is
assume everything is a dot, and do a matched filter for that before
slicing. We can then infer that a dash is three dots without intervening
intracharacter spaces, and we can infer that the intervals between dots

are the 3 space symbols (and determine *which* of the space symbols they are by measuring the interval between voiced symbols). Note that this latter is part of the *decoding* problem, not the demodulation problem.

Further, we are making an inference that there is no signal. It could have faded. And we may detect a signal, but it can be interference rather than the signal we are trying to copy. **WE CAN'T KNOW** at this point what it is. With FSK (or other fully voiced modulation) we will know we have a fade because we must always have energy in one of the channels, or we'll know we have interference because we'll have signal in *both* channels at the same time. There is no ambiguity. Knowledge of where we have an erasure, either due to fading or interference, is very valuable, and can greatly ease the job of error correction.

If we make some assumptions about the transmitted OOK signal, there is a way to *indirectly* do this for it too, but it doesn't equal the quality of information we can extract from a fully voiced signal. Thus we can't achieve the same effective SNR with OOK that we can with FSK. This ambiguity cost is separate from the 3 db more signal we have simply due to the transmitter always being on. This ambiguity reduction gives us a 3 db improvement in signal space, IE it is the ratio of allowed versus disallowed vectors in signal space. This is why we have a total of 6 db better margin with FSK over plain OOK (without considering the advantage of being able to do full matched filtering on the FSK signal before demodulation if we use a uniform code). As noted, there is a way to recover some of this with OOK (using a varient of the turbo coding decoding algorithm).

Note that there are two separate issues here. We have OOK vs FSK (where FSK is acting as a stand in for any fully voiced modulation, some of which are better than FSK, IE BPSK). And we have a variable length code with non-uniform symbols vs a fixed length code with uniform symbols. We can mix and match between these to give us a uniform coded OOK, or a variable length coded FSK as well as the more normal variable length coded OOK and the uniform coded FSK. And indeed, RTTY was once done with OOK and Baudot code, and Morse was once done using FSK (arc transmitters which couldn't easily be OOKed, but could be FSKed by keying a reactance across the frequency determining tank).

We have to be a bit wary of getting these things confused. The issue of OOK vs FSK is primarily an issue of voiced vs unvoiced symbols regardless of what code we use. And the issue of Morse vs a uniform code is primarily one of being able to form a matched channel filter for the demodulator, and one of being able to easily extract a clock for the decoder part of the problem. Both of these latter items favor the uniform code.

Once we fully understand these two separate issues, we can proceed to see what we can do with each of the combinations. It turns out,

of course, that we get the best result if we use a fully voiced modulation
and a uniform code, but we can still make some improvements to the
other combinations over ordinary practice if we examine their strengths
and weaknesses carefully so we can design systems which take maximum
advantage of their strengths, and minimize as much as possible their
deficits.

>or a dash.

This doesn't accomplish anything. We can get the same information
directly from the voiced symbols. In other words, we aren't measuring
anything relevant to signal energy with this "matched" filter. We can
just directly time the interval between detected voiced signals and get
the same information by inference. This may be of some use in a
purely analog detector, simply because the integrated voltage is
proportional to the gap between symbols, but with a digital detector,
we can simply count the interval between detected voiced symbols
directly.

>going to use envelope detection.

You must. You cannot extract timing information from the signal
until you demodulate it and recover the modulating waveform.
That's what the slicer does, and is where you get the "0" you
are inverting (and where you get the "1" you are detecting too).

>The only exercise here is see what can be done with OOK.

When you slice, you regenerate mark and space, that space is unvoiced
is part of the demodulator problem, not part of the decoder problem.
You *must* demodulate to mark/space before you can start to decode.
You keep confusing these two processes. That's understandable to an
extent because you're trying to do them together in a way that doesn't
make it obvious that you *are* performing two different functions.

>> This match filtering of signal energy followed
>> by optimum demodulation slicing is what determines how poor a SNR
>> we can tolerate in recovering the modulating waveform.
>
>Exactly. But we also have to determine as accurately as possible the
>"key up" time.

At the point of demodulation, *WE DON'T CARE* about that. That's
part of the decoder problem, not part of the demodulator problem. Those
are separate things, even if you are trying to combine them in one circuit
(and you can do the job better if you *don't* try to combine these two
functions in a single circuit, algorithm, or process). Take the job one
step at a time, and optimize each step separately.

>it compares a weak signal in one channel to the noise in the other
>channel, so the problem is *almost* the same (we don't have to decide
>"dot" or "dash").

No. The problem is not almost the same. We have a different decision
matrix. In FSK to decode mark, we must have mark *and* not-space,
to decode a space, we must have space *and* not-mark. With OOK
we only have mark and not-mark with space being inferred from the lack
of mark. The full decision matrix for each looks like this:

FSK Mark Not-Mark Space Not-space Metric

1 1 0 0 1 2
0 0 -1 -1 0 -2
? 1 0 -1 0 0
? 0 -1 0 1 0

OOK
1 1 0 1
0 0 -1 -1

? ? ? ?

As you can see, the FSK matrix gives us more information than
the OOK matrix. The metrics are further apart. And note that
the erasure metric for OOK is indeterminate. These factors are
what gives FSK a signal space decision advantage. And this is
*regardless* of what code is used.

>The advantage of FSK is that the transmitter is on all
>the time instead of half the time. The advantage of FSK is 3 dB for this
>reason, if the transmitter is peak power limited. The advantage has been
>incorrectly called 6 dB. Not true. In fact some CW transmitters with 50%
>duty cycle can often run twice as much power (my 30L-1) as FSK.

Two points. As amateur radio operators we are limited by regulation
to a maximum peak power, so we must assume we are peak power
limited when we wish to maximize our communications capability.
In other words, we aren't limited to your 30L-1, we can use any
amplifier we like to maximize our communications effectiveness,
limited only by the PEP output regulation.

And second, as noted above, the larger decision matrix metrics of
FSK are what give it the extra 3 db of advantage over OOK beyond
the difference in average symbol power transmitted. (And again,
this neglects the further advantage use of a uniform code would
convey by allowing a matched channel filter before slicing. That
advantage exists whether the modulation is FSK or OOK, and it
can be quite substantial.)

>work with strong adjacent channel sigs. The HF CW bands are something

>that I know something about and I know that "efficiency" of the waveform
>is not the only thing that matters in this environment. Quite often it
>is not even the most important thing.

Well, I only have 34 years of experience as an amateur, but I do know
that I can maintain a *narrower* bandwidth with a phase continuous modulation
than I can with OOK for the same data rate. I also know I can use matched
channel filtering if I use a uniform code. Combining both techniques will be
superior to OOK Morse in a crowded band with poor propagation conditions.
So if that's what you are really after, then that's the way to do it.

If you don't care that you can occupy less spectrum and emit less signal
while maintaining an error free communications link with a uniform code
and a fully voiced modulation, but instead just want to maximize what
you can do with OOK Morse, then that's a different topic.

You've sharply limited what you can do, but I'll be happy to discuss
various ways you can do it better than what is common amateur practice,
and that does *not* include pseudo-match filtering an artifact of slicing.
I find the challenge of machine decoding of this suboptimal coding and
modulation interesting. In the spirit of Deep Blue, it would be amusing
to develop a computer algorithm which decodes Morse better than a
human can.

>> This is why uniform duration symbols are preferred.
>
>I know what is preferred. Do I have to keep on repeating myself?

Only as long as you claim you can match or beat the performance
with Morse.

>The rest is just repetition and I am going to quit now. Let me be clear
>about this subject:
>
>!) I have no quarrel with the superiority of various other waveforms. I
>am pretty well informed in these matters, more so than you may think.
>
>2) I want to preserve Morse CW mode in the crowded HF bands. There are
>already segments of these bands where wideband modes are used, and that
>is fine. I just want a status quo in this regard. I think that is reasonable.

I don't consider maintaining the status quo reasonable when I know we can
do better, and when I know that maintaining the status quo defacto means
that we *won't* do better. Note I'm not saying that everyone must abandon
methods they like, there is plenty of room for diversity in amateur radio, only
that we should be aware there are better methods, and adopt them as we see
fit instead of limiting ourselves to only status quo methods.

>3) Morse code CW is not being exploited to the maximum extent that is
>possible with today's technology. The exploitation that I am talking
>about is no piece of cake technically, by any means. I think Beezley has
>done some good work. It is also probably true that my specific
>suggestions may need to be reexamined in detail, but I think I am on the

>right track, in general. But to just be stubborn and say "it's
>worthless" does not reflect well on those who keep on propagandizing in
>this manner.

But I've never said it was worthless, only that we can do much better,
at a lower cost, and with a better sharing of the limited spectrum resource
with others, if we adopt a different strategy. It isn't necessary that
*everyone* adopt the new strategies for them to be beneficial in terms
of average communications effectiveness and average better utilization
of spectrum.

>4) I want to preserve Morse code because of its simplicity and world
>wide recognition. I do not have your revolutionary zeal in this matter,
>and I am proud to admit it. I want to preserve Morse code testing in
>some limited way.

I don't have a problem with your wish to preserve Morse code, nor do
I have a problem with those who want to preserve analog DSB AM
voice transmission. Both are suboptimal, but as I said, there is room
for diversity in amateur radio. But I do have a problem with involuntary
manual Morse speed testing as a barrier to licensing for use of the HF
spectrum. If that is the only way you can preserve Morse, then I think
the cost is too high.

(And BTW, I don't think Morse code would vanish from amateur radio
if manual Morse speed testing were eliminated as a licensing requirement.
I believe there are enough people with nostalgic leanings to keep it going
anyway, just as there are people who keep antique vacuum tube equipment
going despite there not being a mandated requirement to do so.)

>5) There are *very many* people who *want* to operate CW, and I think
>they are entitled to do it. There are many folks who, for one reason or
>another, want the simplicity of CW gear, especially QRP. They have
>rights also. That's right, isn't it? The drift that I get is that it
>doesn't matter what they want, it's what a certain "elite" group
>(clique) wants that matters. That is the kind of crap that I think we
>can all do without.

I don't see that at all. Virtually no one has called for the abolishment
of Morse code *use*. What has been called into question is the
Morse Myth of superiority over methods which are demonstrably
better. There has been no call for anyone who desires to use Morse
to abandon its use. Amateurs are not required to use only the best of
methods.

And what has been called into question is the mandate of manual
Morse speed testing as a prerequisite to access to the HF spectrum.
That is both unjustifiable and illegitimate as a use of government
power because the reason for such testing has become moot by
changes in the communications environment, IE we no longer need
a way to intercommunicate with life safety services sharing spectrum
with us so that they can tell us to cease interfering with their operations.

That was the original reason for the Morse testing requirement. But that day is gone. We no longer share spectrum with the life safety services, and they don't use Morse anymore anyway (or at least the last of them to do so are mandated to cease in 1999). That leaves Morse as a purely voluntary method of operation for those who desire to do so, and if that desire to use Morse isn't sufficient motivation to learn it, then it deserves to fall by the wayside.

Using government force to prop up a method which can't stand on its own in free and open competition with other methods is an illegitimate abuse of power. (As noted above, I'm confident sufficient people will want to voluntarily use Morse to keep it alive without an illegitimate government forced recruitment effort.)

I don't want to do a blessed thing to the low end of the 20-meter band,
Bill.

> I want nothing more to do with this. All I hear is that the higher
> efficiency of wider bandwidth is all that matters.

Then you haven't heard what I've said. It is *not* my view that the
efficiency (in terms of throughput *or* spectral use) is all that
matters. But "efficiency" is often cited as a strength of CW. I mean
only to disabuse people of the notions that CW "gets through when
nothing else will" and maximizes the use of the available spectrum.
Those conclusions are wrong, period. They weren't wrong 40 years ago,
but they are now.

That *doesn't* mean I want to replace CW with some as-yet-undefined
digital mode. (If that eventually happens, it happens.) But if CW is to
retain a significant place in Amateur Radio, let's make sure we're
keeping it for the right reasons, not because we mistake it for the best
system that communications technology can provide.

> All that matters is
> the revolution in communications that imitates what the military and
> commercial people are doing. Whether it makes any sense for Amateur
> Radio or not is immaterial. So be it, then.

The question is very much what makes sense for Amateur Radio. But what
other services are doing certainly provides a useful yardstick against
which to measure our capabilities.

This slicer *is* the envelope detector.

>than OOK but requires a considerably wider bandwidth.

Not true. We can produce a MSK signal which will have a smaller
power spectrum for the same information rate as a OOK Morse signal.
The narrowest possible spectrum for a 20 WPM rate OOK Morse
signal is 16.66 Hz (OOK is DSB so the power spectrum is double
sided). And in fact we can't decode 20 WPM Morse by ear in that
narrow a bandwidth because it is at the Nyquist limit and removes
the edge shaping which humans need to recover the timing information.
A machine could recover it, though.

But we can easily do a MSK modulated coding which can carry
20 WPM equivalent information in a bandwidth of 2.33 Hz. I
illustrated such a system on the policy group a while back. It
uses a 12-bit word length and common codebook compression
to deliver a 20 WPM QSO equivalent at 1.66 baud, which with
an off the shelf MSK modulator that measures 1.4 Hz/baud at
the 50 db down points, will fit in a 2.33 Hz bandwidth.

This also is a superior weak signal method because of the
extremely narrow bandwidth, coupled with the ability to do
a perfect matched filter in the demodulator before the slicer,
and because of the decision matrix gain of FSK over OOK.
We can even add a rate 1/2 FEC and still fit in 4.66 Hz.

I would note in fairness that maintaining such a narrow
bandwidth over skywave HF paths is difficult due to the
doppler introduced by the varying path length. That limits
the ultimate weak signal ability of any system premised
on going narrower in occupied bandwidth on HF. (You
have to go wider, IE SS, to approach the ultimate weak
signal limit in such an environment.)

But he might be curious how it works, and might want to dig into it
further. Thus he might develop an interest in ham radio, especially
if he can use his computer as part of it.

>3. the equipment can be bought for less than $1000

Bought? Shame! The thing that makes amateur radio unique
is that we get to build and modify. Buy? Pah!

>4. Its fun

You bet it is. Nothing beats the rush you get when your baby
fires up and does exactly what you expected it to do for the
first time. Especially for extreme weak signal work, it is like
dancing on a high wire without a net. You know that if you
did just one thing wrong, it's not going to work. But when
you see that text printing out on the screen when you can't
even hear anything but noise out of the receiver, you know
you've done something really slick.

Not true. We can simultaneously test for a dot and a dash and "choose".
It's easy. Two bucket brigades and a comparator.

>
> Further, we are making an inference that there is no signal. It could have
> faded. And we may detect a signal, but it can be interference rather than the
> signal we are trying to copy. **WE CAN'T KNOW** at this point what it is.

In the presence of fading, stuff happens. Stuff happens with any
waveform. If we're smart we can do our best with the signal that is
available. I never said it was a rose garden. With FSK we have selective
fading. Sometimes the fading bandwidth is extremely narrow and
Mark/Space gets into trouble. I have seen this in HF frequency fast hop.

> With FSK (or other fully voiced modulation) we will know we have a fade
> because we must always have energy in one of the channels, or we'll know

Sure. We all know that.

> the advantage of being able to do full matched filtering on the FSK signal
> before demodulation if we use a uniform code).

Every reference that I have says 3 dB in AWGN. That other 3 dB sounds
like smoke and mirrors to me. I think we have to avoid embellishing
things here that seem to promote a particular point of view. The basic
problem is to distinguish noise in one channel from signal plus noise in
the other channel. In any particular short interval the noise measured
in one channel can easily be equal to or greater than the signal plus
noise in the other channel because of the statistics involved.

> some of which are better than FSK, IE BPSK).

I am extremely leery about phase coherent methods at HF over a skywave
path. Maintaining coherence over skywave is no piece of cake, by any
means. Dixon mentions this most emphatically and I have been through
this ordeal myself.

> Both of these
> latter items favor the uniform code.

Yeah, yeah, OK.

>> When the signal
> >reappears go back to looking at the signal and find out if it is a dot
> >or a dash.
>
> This doesn't accomplish anything.

Sure it does. In noise it is a little bit more info to work with. We can
learn how to exploit it. With OOK we can't afford to throw away anything
that might be useful. I believe I can make optimal measurements of the
"key up" intervals using the same kind of bucket brigades that are used
for dot/dash recognition. We can then write software that will do the
best possible job of choosing among the options a) what signal was sent
and b) what is the time interval between signals. Nuclear event detector
amplifiers look for both amplitude windows and time windows. The idea of
the optimum threshold is important. This must be done "on the fly".

> > I am *not*
> >going to use envelope detection.
>
> You must. You cannot extract timing information from the signal
> until you demodulate it and recover the modulating waveform.

This is definitely not true. Envelope detection is a bummer. Product
detection followed by operations on the audio tone is definitely
superior. Ref: Schwartz "Information Transmission, Modulation and Noise"
3d edition, chapter 5. You can do all the "slicing" and "timing" you
want with this signal. The DSP-filtered audio is a beautiful signal to
work with if it is done properly. It's almost identical to coherent
detection. Very close frequency correspondence is needed.

>
>
> I don't consider maintaining the status quo reasonable when I know we can
> do better, and when I know that maintaining the status quo defacto means
> that we *won't* do better.

That is a non-sequitor. Things are going to get better, technically, but
not on your timetable. You have to literally "change the entire world"
and that is not going to happen on your watch. The HF bands have quite a
bit of data mode stuff going on, even now, but there is strong world
wide interest in CW and you are not going to change that.

That is just soap box oratory, and I really think you should lighten up a little on this subject. We want to retain Morse because it suits our particular purposes. We want to test for Morse because it is an important "gateway" for global communication and also emergency (in certain situations) communication. All of this knee-jerk opposition to CW and testing for it is counterproductive and makes no real sense, in my opinion. And I am not just being a "fanatic stick-in-the-mud".

But we don't have to imitate them.

This all sounds good to me. I have never advocated the technical
superiority of CW Morse code as a signalling waveform.

>Don't ask my why- I don't know know- but it certainly has been true in my
>experience.
>
>Rob.

Dunno about the US, but in the UK I would say a great proportion of
Class A amateurs learn the code and never do anything more than pick up
a mic and talk. Its certainly not a silly idea and I can't see it being
any different in the US than in the UK. Does learning the code make you
technically proficient? The ability to receive audible tones and decode
them does not make anybody a better operator or give them a better
technical know how. Certainly here in the UK its simply used to control
the amount of operators getting through onto the HF bands - end of
story.

As for technically proficient, I would put my money on any amateur who
is capable of setting up a satellite or eme station using low power, or
building a microwave transverter and using it. Anyone can put up a half
decent HF station on the air simply by visiting his local ham store with
a fat cheque book.

If the US is anything like the UK, you guys should be looking at how you
can encourage young people into the hobby, else by the middle of next
century we might not have amateur bands to play on.

Instead of fighting amongst yourself, try and persuade the government
that the bands are used, but don't get so narrow minded to think that
life ends with morse. It is without a doubt a dying, outdated mode. Yes
its fun, but does it really have a place in modern radio licencing? And
what is our current public image like? How do others view our hobby?

Certainly here in the UK our image is poor and we are doing nothing to
alter it. At the moment we are simply an extended CB service with little
to offer newcomers. We either change or die, simple.

>Don Ward G0MDO

Hi Don

Try to find Super Morse dos program on Shareware.com. Using CW or
MORSE for search keyword should get you there.

It is nice an all in one program you can use for learning and building
your cw skill. Uses pc spker or sndboard.

Beside, excellent documentation and help files describe a simple Rx
interface (1- 747 op-amp) btwn receiver and pc com port, to decode
live incoming signal (can also be bought), as well as an interface to
a Tx that can use a keyboard or a bug at will.

Still rated as one of the best of its trade by many readers in this an
other groups.

Hope it helps,

H.C.

Howdy, Tim! Well, the equivalent capacitance of any two series capacitors will be less than the lower value. You could try removing some of the plates to lower the 365 pf capacitance. Are the 10-20 pf jobs you're looking at very small, or are they just as physically large as the one you want to use?

Gary, KE4ZV keeps emphasizing asynchronous nature of Morse code as a great dis-
advantage in machine decoding. This is absolutely not a case in machine gene-
rated code which has a master clock and all the elements are generated from it
in 1:3:5 fashion. Once we estimate basic dot length and detect decent signal
above the noise, we can start synhronous detection by accurately estimating
following element. If it happends to be signal again, we KNOW that we hit dash
and the next element MUST be signal again. If we detect pause (noise) than
there are 2 choices following it: signal or pause. If signal comes we detected
intersymbol pause and we go back to signal flowchart. If pause follows pause
than we KNOW again that we MUST have at least one more pause for character of
more than that (5 or 7) for word. This simple state machine helps a lot...
Even with hand sent Morse, slight variations occur only in long pauses which
do not affect character decoding much. We usually end up with few extra spaces

For a few DX-ers which expressed doubts about the abilities of machines to do
Morse decoding in pile-ups, let me tell you that PC & DSP achieved 80% score
on simulated 5 min. tape while I did about 60% after winning EU championship
twice and being #6 in Dayton 1995 (#1 EU with G3SXW). On the air test in ARRL
DX contest with about 200 CW QSO exceeded all my expectations once PC worked
Kansas on 80m which I could barely detect in QRM. One becomes very humble
after such an expierence just like world chess champ after being beaten by
computer recently. I have seen the future and I stoped my research...

> Or, STAs from FCC are available.

Correction ... those modes are NOT available on the HF bands for
those who have not submitted to the Morse hazing ritual. And STAs
are not so easy to get ... I doubt seriously that the FCC would grant
an STA for a tech, no matter how technically qualified, to use HF
for experimentation with the advanced digital modes.

> The name of the game is "control", where a certain small but strident
> and militant group is not satisfied to do what they want to do, they
> want to tell everyone else what to do. And anyone who doesn't want to
> fall into line is subjected to ridicule and name calling, such as

Up to this point in the paragraph, I would have sworn that you were talking
about the pro-coders ... after all *they* are the ones who insist on forcing
everyone to practice *their* mode ... *that* position sounds a LOT more
like "the name of the game is control" than the anit-code-TEST folks who
say, in effect, "let everyone choose their own mode preferences voluntarily."

> "fanatic", "stick in the mud", "old fart" and so forth, and is subjected
> to other curmudgeonly behavior.

Now these labels, I must admit have been used by myself (and others)
against rabid pro-coders ... I have been publicly chastised by Gary for
this sort of behavior and I respect Gary's opinion, so I am going to *make
an effort* to "tone it down a bit" ... only time will tell if some of the more
strident pro-coders will follow suit ... (Ed has also influenced me to a
degree in this direction, despite the fact that we don't always agree and
I have given him a hard time on occasion ... but he deserves some credit
for influencing my impending attempt at moderation ...)

> The buzz word for them is "educate".
> They are going to educate the ignorant mob.

I am not going to "apologize" for stating the view that far too many
hams are technically backward and incompetent for the privileges
their licenses grant them ... that is, after all, why I have maintained
for a long time that the testing system needs to be fixed so that we
don't have "Extra Class" hams who don't know Ohm's Law or how
to cut a dipole to resonance ...

Your rationale for the lack of need for Morse speed testing in the general
data portion of the bands also applies to the special Morse-only sub-bands
you want to create. To repeat the obvious, if you can't do it, you won't,
and if you can, you will, no other test is necessary.

But having said that, I have no objection to the creation of Morse only
preserves, I prefer to call them sanctuaries, where those who want to
operate Morse can do so in peace without having to compete with other
signaling methods. I'd even suggest using the existing Extra segments
at the lower ends of the HF bands for this purpose. And I'm not sure
that a QRP power limit is necessary. Of course Morse operators could
continue to use any other part of the bands too, but on a fully open
competitive basis with other methods.

Hi Gary, it's a lot like our keyboard layout which was originally
designed to slow typists down so the mechanical keys wouldn't jam.
Whatever happened to the superior Dvorak keyboard layout?

Speaking entirely personally, as a CW op, I see no reason not to
continue to have CW shared with those other modes with which we have a
demonstrated reasonable compatibility (translate: the modes we are
currently sharing on HF). If FH SS turns out after further study by
the amateur community to be compatible with existing amateur CW and other
digital operation, I would see no reason not to share spectrum with that,
too.

<cut>

We have discussed the possibility of using a modified car/truck alternator and I believe you will easily achieve your goal of 20-30 amps (1KW @ 50V) as most of these are rated standard at 60-80 amps. I suggested looking for a 24V unit to modify (common in small trucks round here) for the simple reason that they will be better suited for the higher voltages than an overdriven 12V type. Our relative costs for a good S/H unit is about the same as a new car battery.

Another option you did not comment on was a commercial inverter feeding a regular power supply. To realise 1KW from a 12V source with typical inefficiencies the draw is probably nearer 100-120 Amps. A friend has just equipped a bus with 2x 5KW inverters which power his mobile computer system in connection with his business. It was not a cheap exercise. I believe he has a small diesel generator fitted underneath the bus to maintain the second set of batteries.

Yet another option could be the purchase of one of the small Honda type petrol driven portable generators if you do not need to be mobile when operating. These come in all sorts of standard sizes suitable for you needs. They are common in the bush out here where regular power is not available.

# 3427. TIRIS Antenna design

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-09 00:00:00 UTC
From: Marius van Wyk <jsm@intekom.co.za>
Message-ID: <01bcd4ff$01bace60$9e6f19c4@Intekom4272>
Source record: 90068

Hi.

Could someone please provide me with information about the design of a loop antenna for use with the TIRIS RFID Microreader?

The antenna must have a Q factor of between 10 and 20, and must have an inductance of 47uF. What I need is the steps how to design this loop, or rectangular loop antenna.

Any help would be greatly appreciated!

Greetings
Marius

I recommend an antenna 70 feet long and fet with ladder line. Put a
cheap, simple tuner with tapped inductor on your end of the ladder
line to tune the system. This will improve the signal to noise ratio.

Hi John,

For receiving only and under some space limitations you should
try a tuned loop. The ARRL Antenna Book has a whole chapter about
that... I made one for receining and transmitting on 15..20m and
it works fine, even indoor.

I expect there will still be small hunks of spectrum around for analog FM _and_
CW 100 years from now. The really important (read money) stuff will be above
70cm, and below will be scientific heirlooms (read historical societies
and national parks).

This isn't a bad suggestion, but Morse doesn't have as much
redundancy as speech, so there isn't as much for the algorithms
to get their teeth into. The recursive trellis I suggested in another
note uses almost all of the available information in the signal, so
it is about as close as we can come to implementing the ideas
involved in the speech recognition systems.

As far as I know HAM radio is exempted.
I am in favor of any bill that blocks the monitoring of "private
conversations". HAM radio is not "private communications" ...
HAM radio is on the public airwaves and can be heard by anyone with a
radio that can tune the ham bands. Hams at my ham clubs are in favor
of this bill's idea (I have not seen the actual bill ... just heard it
talked about at our club meetings).

W4SCO

I am also a private pilot and communications on the aviation bands is
also not "private" so it should not be affected either.

Yes, VE2IQ (and group) are getting very good results with BPSK on
3591. But don't write off CCW quite yet. What Bill's program did
was not quite the same thing as what Petit had in mind for CCW.
It had the external clocking reference, but it lacked the RF coherency
of Petit's scheme. The latter is what made that a really superior
technique. Most amateurs found it too hard to implement in practice,
however, so it has fallen by the wayside. (And dynamic path length
changes also doomed maintenance of RF coherency for HF skywave,
though it works well for LOS VHF and for Part 15 VLF groundwave.)

>Computer decoding of Morse signals is an interesting challenge and I

Well, I think it would be neat to pull a Deep Blue and beat the human
wetware modem in its last bastion. It is unlikely to be a popular technique,
however, because if you're going to throw that much computer power at
a communications problem, you'll get much better results by changing to
a better code and modulation than OOK Morse. So there's no real utilitarian
reason to do it, but it is a fun challenge.

How are you going to do that? All a bucket brigade can do is delay the
modulated carrier. And splitting the signal power into two paths is going
to cost you 3 db. I'd think that would be the *last* thing you'd want in
a weak signal system.

>> Further, we are making an inference that there is no signal. It could have

Yep, it can be a problem if you use symbols with lengths similar to the
fade rate. That's why you don't do that.

I refer you to Wilson, _Digital Modulation and Coding_ , for the derivation
of this signal space decoding gain. He devotes a full chapter to developing
the ideas which lead to this gain, but the decision matrix I posted gives the
basic idea clearly enough. There is no smoke or mirrors involved, just sound
information theory applied to FSK signaling.

>> some of which are better than FSK, IE BPSK).
>
>I am extremely leery about phase coherent methods at HF over a skywave

>means. Dixon mentions this most emphatically and I have been through
>this ordeal myself.

Yes, I agree. The path dynamics introduce a pseudo-doppler to the signal
which makes phase tracking a very difficult problem. It can be solved, but
it requires considerably more signal processing than for incoherent FSK.
VE2IQ successfully addresses it in Coherent (which uses BPSK), however.
The 3591 gang has to deal with the worst multipath environment on HF,
nighttime 80m short skip skywave. And he does it on an original PC-XT!!!

>> Both of these
>> latter items favor the uniform code.
>
>Yeah, yeah, OK.

And note that we pay no penalty for using a uniform code. We can
even use a uniform code with OOK modulation, though obviously
we do better with a fully voiced modulation such as FSK. Years
ago, we did RTTY by OOK. Most of us who have done RTTY
for many years can read some of it by ear, and it is at 60 WPM.
Slow it down, and it is no harder to read than Morse, and we can
use optimum filters for it. So if you want to keep OOK, you can
still do better with it if you don't use Morse as the encoding.

And experience from many years ago (arc transmitter days) shows
that operators have no trouble reading Morse sent via FSK modulation.
In fact, psycho-acoustic research done as a doctoral thesis recently at the
University of Lund shows that the human ear/brain is more sensitive to
pitch variations than to amplitude variations, so FSK Morse should be
easier to read in noise than OOK Morse. Thus if you want to keep
the Morse encoding, you'll still do better if you transmit it by FSK
modulation.

Either way, the worst combination is OOK modulation with Morse
encoding. The *only* real justification for dealing with that at all
is to accomodate the current large installed base of OOK Morse
trained operators who don't want to learn something even slightly
different.

You cut a lot of context there. I'll let that pass. What you say above is
very true, we can't afford to throw any information about the signal
away, but your method isn't preserving the maximum information
about the signal, and it isn't using it in an optimum way. See my reply
to Paul for a better scheme.

The "tone" is still an IF frequency. You can IF filter it all you like
(within the constraints of still passing the modulation sidebands),
but you haven't demodulated it until you slice it. Slicing *is*
envelope detection, and that's what recovers the modulating
waveform you need in order to recover the Morse timing sent
by the key at the other end. This is basic and fundamental.
Your "product detector" is just another IF mixer to this AM
modulated carrier. The signal isn't demodulated until you slice it.

Greetings

It is rather easy to convert some of the CB gear to 6meters. I have converted the old Sears "Roadtalker-40" without having to buy any new parts. All that was required was to use the LO+IF mix term instead of the LO-IF product. Had to retune the RF related coils to '6' from '10' and it worked great (still does).

Get a schematic and dig-in to that old rig - have fun too.

Source record: 90208

Back when I studied a wee bit of signal processing, there was a
clear distinction between the information and the code. I read
'understand' as something like context analysis. IE, 'th' followed
by enough space for the character 'e' and a word space followed
by a word that 'makes sense' is very likely to be 'the'.
A somewhat simplistic example but that's about my speed.

I believe more modern coding takes things like this into account
as part of the code generation and so wouldn't benefit from post
processing for context. An extreme example would be a fractal
representation of a message. If any part of the polynomial is missing
the message can not be decoded. That is, it's all or nothing, up front.

Some of what morse sacrifices in efficiency as a code appears to be
retained in that there is more there to work with 'at the other end'

I'm not defending morse as the best code or anything here, just
curious as to how things look from an efficiency standpoint
when the contextual and timing clues one is stuck with in morse are
considered.

I'll leave the math to someone who has been practicing or might
possess some innate SP skills that I do not :-)

Not true. The dash can also be determined. I keep hearing "dots only". It ain't so. I wish we would all break away from that idea. The dash is exactly 3 dots long and can easily be separated from a dot, and its on/off transitions can easily provide inputs into the clock synch process. For a Morse OOK system we cannot throw away *anything* that might be useful.

> Word space will present a
> problem for us if it is extended too long, but if we can assume
> that the operator is keeping the que full, it will suffice.

Word space must be an integral number of dots plus spaces. One other thing: the clock synchronization process can be "attenuated" or "weighted down" (but not completely turned off) during periods of uncertainty about the signal. In other words, only well defined on/off transitions are given top billing. As part of this process, the adaptive threshold level calculation is crucial.

> If we reach a dead end, IE an

> the highest probability of being a correct decoding.

Before a dead end or a long pause, automatically send a termination sequence, like some other data guys do, if there is a break longer than say 10 dot + space lengths. A manual operator will also recognize this.

Also, take advantage of one of CW's greatest assets, full QSK break-in. Insert a capability for an automatic ACK process. QSK CW operators routinely use redundancy in this manner for error correction. The machine must, at the very least, duplicate everything that skilled operators do. The interrupting code can be a string of dots that the receiving machine can recognize, which is what operators often do.

Hi Bill, If the envelope contains the modulation, then de-modulation
*is* envelope detection. Consider a correlator where the sample
rate/phase is synchronized to the peaks of the IF signal. That is
certainly envelop detection. Asynchronous sampling plus correlation
is just a mathematical manipulation of exactly the same concept.

Two bucket brigades, operating *in parallel* will not degrade anything. The outputs of the two can be sampled simultaneously to make the decision "dot" or "dash". This is not the big deal that you keep insisting on.

I keep trying to see your viewpoints, and I would like to see some reciprocity. I'm not as wrong about almost everything as you try to make it appear. If this is just some kind of pissing contest, then I don't want to be bothered with it any more.

>
> You cut a lot of context there. I'll let that pass.

This stuff is growing exponentially and I'm not going to get into a quagmire about it. If it grows out of hand, I'm the one who is going to let stuff pass. You will do what you like.

> What you say above is
> very true, we can't afford to throw any information about the signal

That's your opinion, it is not my opinion.

> The "tone" is still an IF frequency.

Wrong. It is the *final* signal and it is *not* the same as envelope detection. Time domain DSP filters (correlators) are used all the time to make timing decisions, and it is not envelope detection. I think you should hit the books on that topic. There is a time delay involved. So what?

>
>Er, I think this concept first came from Shannon in the 1940s ...

Shannon's work is the basis for so much of modern communications system design that it is tempting to say he thought of everything. But Jon is right, Costas was the first to specifically point out the time-bandwidth product of the entire system was the thing we must optimize to maximize aggregate spectrum usage efficiency.

That's one of the problems here, many of the advocates aren't concerned with their impact on others, only with their own operation. Thus the benefits of things like SS aren't readily apparent to them. But we *must* share, the FCC makes that very plain, so we have to look at the effect of our operation on aggregate spectrum usage efficiency, both in the time domain as well as the frequency domain.

A cellular "phone" is a RADIO. It's frequencies are no different than
the ham bands or the aviation bands. It's interface is very similar to
a telephone, but it's a RADIO. More to the point, I hope you don't
really think this bill is about protecting cell phone users. If you do,
then you won't mind giving up your ham radio or your pilot's license
when they are considered to violate someone elses civil rights. After
all, you can spy on me in my back yard with that Cessna, and you can

plan the demise of our government with your ham buddies. You say that ham radio is on the private airwaves. How do you think a cellular phone works?

Unless you have a reliable phase lock with the incoming (audio-IF)
carrier and use it to clock the bucket brigade, I see no point of
feeding the IF signal into the bucket brigade. However, if you take
the absolute value of the signal (full wave rectification without
filtering) and feed it to the matched filter would make more sense.
(There might even be some advantage of squaring the input signal, e.g.
for determining the SNR and feeding a signal proportional to the
instantaneous _power_ into the matched filter. Absolute value and
squaring can be generated in a single 4 quadrant multiplier feeding
both inputs with the IF signal). Feeding unipolar signals into the
matched filter requires that negative coefficients has to be used to
match the space. To detect a dot, which is space, mark, space, the
coefficients -1, +1, -1 will be needed. A dash is space, mark, mark,
mark, space and thus coefficients -1, +1, +1, +1, -1 would have to be
used.

>And splitting the signal power into two paths is going
>to cost you 3 db. I'd think that would be the *last* thing you'd want in
>a weak signal system.

While splitting the antenna terminal signal power into two paths in
equipment limited environments will degrade the SNR by 3 dB, I do not
see how this is relevant in this case, when we typically have several
stages of amplification (that determine the noise figure) ahead of the
splitter.

Soundblaster cards have a PC speaker input connector. Disconnect the PC speaker and connect a jumper cable between the speaker connector on the mother board and the speaker connector on the Soundblaster card. Now all PC speaker beeps, etc come through the Soundblaster card and speakers.

## 3458. Listening to Cell phone on a scanner.

Newsgroup: rec.radio.amateur.homebrew

First, yes I know it is illegal to do it ( and I don't).
Second, I know there is probably a better group but I can't find it on the list I have.

But, at our ham meeting last night we got to talking about the scanner bill that is in congress and to subject came up.

Now here is the question: Is it possable to hear both sides of a cell phone conversation on a single freq. I say no. Cell phones are full duplex, one freq. goes from the radio to the tower and the other frome the tower to the radio. Two of the people there said that in %90 of the time they can here both sides of the conversation. What is going on.

Thanks
Peter/KA5COI

I wanted to try and stay clear of generators due to the noise.
I like the inverter route but have been unable to find a high wattage dc
to dc inverter at my required power level.
The 24v alternator is something to consider, thanks.
Part of my challenge is wanting to actually stay mobile, I have several
other QRO mobile friends but several of them are limited to stationary
operation, like we're talking 19 foot high antennas:-)

Thanks again for your feedback.

I suggest that you read the bill and not make judgements without
reading it. I should preface this with the fact that HR2369 is being
"reworked" as the author admits that it was "flawed", but the bill
would have changed the 1934 Commuications Act to read "intercept and
divulge" to "intercept or divulge". It would be illegal to listen to
anything as a third party that was not exempted. The exemptions are
public radio and TV, ham, CB, and unencrypted TVRO. As such,
listening to the aviation bands would indeed be illegal.
*I* am in favor of the cellular telephone industry either going
digital encrypted or informing people that they are,in effect, talking
on a radio and their conversations are capable of being intercepted.

There is also a variation that used a sharpened pencil
lead (graphite?) instead of the safety pin to contact the
razor blade. Another method had a sewing needle balanced
on two pieces of carbon.

Kinda makes you wonder about all this new gadgetry!

John,

Depending on how concerned you might be to any
directional nature of the antenna, you might
consider a multiple dipole arrangement. I've
done this for the Ham Bands at 40, 20, 15 & 10 Meters,
and it worked well.

Run coax to center of roof reak beam on longest axis
of roof (assume that is the 70' measurement). Depending
on which side of the argument you subscribe to, you
may want to use a balun. The same goes for the utility
of using a tuner at the receiver end.

Cut dipoles for each "World Band" you wish to receive and
connect to the center insulator/balun.

Dipoles should end up as either straight dipoles or
inverted "V" antennas. One can run the length of the
roof beam, two to opposing corners (e.g., NW-SE and NE-SW),
one could run perpendicular to the center roof beam, and
the others can be installed to provide a broad
Fan Dipole type arrangement.

This will give you a pretty broad banded antenna, with some
directional impact, and still have some benefits from the
individual elements being cut to length.

The coax run might avoid some noise pick up in the house.

FYI - Some insulation is foil backed and may cause some
shielding problems if installed on the roof portion, rather
than on the attic floor.

Have Fun! Dave K7HMP

>A somewhat simplistic example but that's about my speed.

Bob, there is information on several different levels here. The
first level of information is information about the signal being
received. In a coherent system this includes amplitude and phase
information about the carrier, and in any system it includes
information about the amplitude and phase of the modulation
envelope.

The next level of information is information about the elements
making up the code symbols, IE in the case of Morse, the dot,
the dash, the intracharacter space, the intercharacter space, and
the word space timing edges. From this information, we can then
build up the symbols for the alphanumerics being received.

And finally, at the top level is the information contained in the
message itself. This information is not dependent on the modulation
or coding being used. For our amateur uses, this information is
usually English text. So contextual decoding has nothing to do
with the underlying modulation or coding system being used.
It is solely dependent on our knowledge of English spelling and
grammar, and dependent on our knowledge of the usual content
of amateur QSOs.

>I believe more modern coding takes things like this into account
>as part of the code generation and so wouldn't benefit from post
>processing for context. An extreme example would be a fractal
>representation of a message. If any part of the polynomial is missing
>the message can not be decoded. That is, it's all or nothing, up front.

Modern codes generally contain redundancy in the form of uniform
code lengths and forward error correction bits to enable you to detect
and correct transmission errors. If the channel errors are so great that
they overwhelm the FEC, you still aren't left with nothing. You still get
the corrupted message, and you know *where* it is corrupt. There may
be enough fragments of valid text in the message that you can apply
contextual clues to make an informed guess about what the message
was supposed to say. You have no guarantee that your guess will be
correct, of course.

>Some of what morse sacrifices in efficiency as a code appears to be
>retained in that there is more there to work with 'at the other end'

No, Morse has *less* redundancy than many other codes. That's
partially inherent in the nature of the variable length coding used.
The codes are variable length because redundancy has been *removed*
in order to shorten the code. This *reduces* the information being
transmitted in the first two senses listed above. So it reduces the
probability of being able to do a correct decoding.

In another sense however, there is more information per code bit in
Morse, because of the lack of redundancies which would have been
useful for error correction. This is the information in the Shannon
sense, IE the novel message content. Because this information is
relatively "naked", it is much more vulnerable to channel errors
and decoding errors than if it were transmitted by a code with
more redundancy.

>I'm not defending morse as the best code or anything here, just
>curious as to how things look from an efficiency standpoint
>when the contextual and timing clues one is stuck with in morse are
>considered.

With Morse, you only have two clues you can use for error detection
and correction. If you receive an illegal code element sequence, you
know you have an error. And if the novel message content makes
no contextual sense, you can also expect that there has been an
error. There aren't that many illegal code sequences in Morse,
however, because of the lack of redundancy due to it being a variable
length code, so you can easily have an error which changes a code
sequence from one legal sequence to another, thus this isn't a very
reliable error detection mechanism.

Contextual guesses based on content form your other defense against
errors, but so many amateurs can't spell, and don't use good grammar,
that this isn't a reliable mechanism either. The one saving grace is that
amateurs typically do "cookie cutter" contacts, so there really isn't
very much novel content in the message. Most of it is so pro forma
that you can easily regenerate it, even if you actually copied virtually
nothing from the signal.

Example, most Dx contacts only have one novel bit of information,
the call sign of the station calling the Dx station. Everything else is
known a priori, IE the RST is always 599, the Dx station's call was
extracted from the PacketCluster, etc. So all you have to do is get your
call sign repeated back by the Dx station and you're done. (And if you
are working list operation, even that is known a priori as well, so there
is *no* novel content, IE no information in the Shannon sense, being
exchanged at all. If you detect any sort of signal at all, even if it decodes
to gibberish, you still log the contact because you *know* he was
sending your call sign from the list because the listmaster said it
was your turn.)

>insisting on.

You have very little signal power available, and it is buried in noise.
If you split that power into two paths, each path has 3 db less signal
power to work with than a single channel would. Now the receiver
bandwidth prior to the split has to be broad enough to pass the
widest modulation sidebands, and since you can't do matched filtering
of the (not known a priori) modulation before the split, there will be
excess noise power available at the point where you do the split.

Noise power comes from two sources, external noise, IE atmospheric
noise, and internal noise. The atmospheric noise splits into the two
channels equally, but internal noise in each channel adds to that. So
you degrade SNR, probably not by a full 3 db in the dot channel on
HF, but certainly by more than 3 db in the dash channel (which will
have excess noise compared to dash signal). If you were operating at
VHF+, it would be by almost a full 3 db in the dot channel too since
internal noise dominates, and analog bucket brigade devices are pretty
noisy, both in a thermal sense and also due to corruption by clocking
artifacts. The latter is often the killer with weak signals.

>I keep trying to see your viewpoints, and I would like to see some
>reciprocity. I'm not as wrong about almost everything as you try to make

>want to be bothered with it any more.

What Jon and Paul and Mathew (and even Carl) and I are telling you
is not some fairy tale. The demodulation problem and the decoding
problem are well understood today. There are many books available
which explain how various techniques affect the enthropy of the

system for various modulation forms and codings. Two in particular
I would suggest are "Modern Signals and Systems" by Kwakernaak
and Sivan, and "Digital Communications Techniques, Signal Design
and Detection" by Simon, Hinedi, and Lindsey. I'd also recomend
Wilson's "Digital Modulation and Coding" to you as the most readable
text I've found on the information theory underlying the signal design
and decoding problems we're attempting to address, and the locally
optimum techniques for solving them.

As you have acknowledged, there are penalties to be paid for using
OOK AM modulation, and for using Morse encoding, so there is no
longer any reason to fight with you. But accepting that, there are still
locally optimum ways to demodulate and decode signals using them.
You aren't doing that. In fact you seem to have a conceptual difficulty
with the idea that you must envelope detect the OOK modulation before
you can start to decode the coding it carries. At this point, most of us
are really trying to help you rather than just pick fights with you. If
it seems like we're fighting you, it is only because we are trying to
show you where you are going astray.

Fine. But you are going to be the one lost in a quagmire if you don't
listen. Your approach is fundamentally muddled on a very basic level.
If we can clear up that muddle, you'll find you'll be able to do a much
better job of developing locally optimum ways of demodulating and
decoding OOK Morse signals buried in noise. You profess that to be
your purpose, so let us help you do it.

>what?

Bill, a correlator used to extract timing edges *is exactly equivalent to* a
matched filter and envelope detector. Mathematically they are the same
thing, just implemented in different ways. The same principles apply, as
do the same limits. This is clearly explained in the books I mentioned.

You *are* envelope detecting whether you believe it or not. That's the only way to demodulate a DSBWC AM signal (short of synchronous demodulation). That would be better, but would require extracting a coherent carrier reference, and that would be difficult with an arbitrary OOK Morse signal because you'd have to find a way to maintain a tight coherent phase lock to the carrier during the <arbitrarily long> word space intervals over a skywave path.

That's a can of worms *I* wouldn't want to touch. Of course if you were to use a common external reference for carrier phase, as Petit attempted in his original CCW approach, you could do synchronous demodulation and pick up (almost) 3 db against the incoherent noise floor (compared to envelope detection) if you could deal with the dynamic path length changes in the ionosphere. But that means every contact would have to be prearranged, and I don't think that's what you have in mind.

>--
>73, Cecil, W6RCA, OOTC (not speaking for my employer)

IBM used to offer the Selectric with a Dvorak keyboard. The
problem was that you had to learn both systems if you also used
other people's typewriters. So it never caught on. But with
computers, it is a snap. There are Dvorak programs you
can use to rearrange the keys of a QWERTY keyboard (the
program alters the scan code to ASCII lookup table in the
computer). If you have that on your personal diskette along
with your other favorite tools (text editor, hex editor, etc),
you can make any computer work just like the one you
have at home.

Once you learn it, typing is markedly faster, and there is less
risk of injury (carpal tunnel syndrome) when using the Dvorak
layout too. (Actually, I use a *modified* Dvorak layout that
is somewhat better optimized for computer input.)

I am *very* picky about keyboard feel. I've thought about
burning a custom keyboard controller to generate the revised
scan codes directly for my favorite keyboard, so I can just
plug it into any computer and have both my favored layout
and my favored keyboard feel everywhere I go. But I haven't
done it yet. That may be taking customization a bit too far.

And the way Newt got burned is by a couple listening (against the law) in their car ... then making a tape (against the law) ... then sending that tape to a democrat congressman (against the law) ... who then committed a federal crime by playing that tape to the public. But because he played the tape on the floor of the House he is protected from prosecution.

I wonder ... has that couple been prosecuted under the federal statues yet? They certainly should be to the maximum extent of the law to set an example for others!!!!

Absolutely correct, Cecil. That seems to be the prime cause of
difficulty, IE getting Bill to see that he has to recover the modulation
before he can decode it. He's trying to do both things at once, and
that leaves him with suboptimal solutions to both problems.

: basically the same results or am I missing something?

Well, I think you are missing something, unless you want a really wierd tuning curve. Think about the total capacitance, versus rotation of the 365pF variable. When it's at 365pF, the net (w/10pF series) is 9.7333pF. When it's at 365/2 pF, the net is 9.4805pF. When it's at 365/4 pF, the net is 9.0123pF. When it's all the way open, it's probably still more than 10pF...if it was 10pF, the net would be 5.000 pF. So, most of the change comes in a tiny part of the range.

You can actually make it more linear tuning by paralleling it with something like 500pF and putting, say, 20pF in series with that... Suggest you get out your favorite spreadsheet and make a column of % rotation, variable capacitance, net capacitance, and resonant frequency. You can then plot frequency versus % rotation and see how (non)linear it is. Spreadsheets are quite handy for this sort of thing.

The dot filter consists of a bucket brigade with tap weights of +1-1+1-1
etc, say 10 taps per dot. A feedback loop (early/late detector) will
synchronize this bucket brigade with the incoming signal, just as in a
spread spectrum system. The dash filter has 30 taps and performs the
same function.

Again, I am sure that this "splitting" doesn't make any sense. It does not have to be done.

Thanks for these inputs.

Hello everyone, I'm the one still working on the blasted tranverter (10m to 2m), there seems to be a dearth of 2m signals here in Leeds, UK. Can anyone confirm this? What is the best time to try 2m? I have only heard a couple of amateurs through my transverter, (thru' loss ca. 0-3dB) and never more than one per evening (not even digital or morse!). The antenna is a dipole on the ceiling of my basement flat (yes, I know, not optimal). TIA for any info on 2m

Thanks. FCC willing, we will.

>I want nothing more to do with this. All I hear is that the higher
>efficiency of wider bandwidth is all that matters.

Like I said, you aren't listening. Wider bandwidth systems can
be more efficient in some cases, but we can do more efficient
*narrower* bandwidth systems too. At comparable information
rates, we can fit MSK systems in a narrower bandwidth than
you can a DSB AM (OOK) system. And we can operate them
at a lower noise margin too.

>All that matters is
>the revolution in communications that imitates what the military and
>commercial people are doing. Whether it makes any sense for Amateur
>Radio or not is immaterial. So be it, then.

Better techniques almost always make sense. That's why we aren't
all still using rotary spark gaps and coherers. At one time, amateurs
pioneered early deployment of better techniques (amateurs didn't
invent everything, but they were quick to exploit new techniques,
and often to make improvements to them). The military and
commerical worlds *lagged* amateur radio, and "borrowed"
(sometimes whole cloth) the best of amateur techniques at the
start of WWII. Even as recently as Desert Storm, the military was
forced into the open market to buy amateur data controllers to
supply them with tactical data communications. But that is no
longer the case. Amateurs now lag behind the commerical and

military worlds in virtually every area. That's arguably not good, not good at all, for the future of amateur radio.

Note very very carefully that I am *not* saying that amateur stations should become small copies of a military comm center, or that every amateur station should have the capabilities of a NASA DSN site. But we can all benefit from some of the techniques they use, and from some of the techniques which have found their way into consumer electronics. When I got started in amateur radio 34 years ago, I never dreamed that cheap consumer electronics would become more powerful and sophisticated than the equipment amateur radio operators would field. But that's happened. We've virtually stood still while they have rushed past us.

Hi Marijan, what you say is true but not very useful. If you must have a machine
on both ends then it is logical to improve the coding technique to FSK/PSK/MSK
using a fixed "word" length with framing/redundancy bits and FEC.

Thank you very much for the most meaningful post, by orders of magnitude,
than any other in this very long discussion. I'm an outsider here (only
SWL). You people need to understand that the longer and more bitter this
argument gets, the more likely that you will ALL lose your spectrum. I see
no reason why all of the many motivations behind the use of amateur radio
cannot be accommodated. Technical arguments are interesting, instructive
and occasionally decisive. But I have spent my working life listening to
technical arguments which were being used to address, circumvent or ignore
non-technical problems. This is another such instance.

Just keep making that disclaimer, and start *believing* it, and its
implications with regard to spectrum utilization, and you won't hear it.

>2) But there are other factors involved that we insist on ignoring, in
>our enthusiasm for technical perfection as the only issue that is
>allowed to be considered (it is politically correct, right?).

It is a technical hobby. Striving for technical perfection is a part
of that. With computing power cheaply at our disposal, arguments
of cost and complexity become moot (the radio equipment is not
significantly different in either case). Arguments of the sort that
end with "because I want to" are always still valid, of course.

You aren't *required* to use optimal systems if you don't want
to. You can use whatever you like for *fun*. The only limits
are Part 97, and good amateur practice. I doubt OOK Morse
will ever be prohibited by either of those. Unlike spark, use
of OOK Morse isn't very spectrum consumptive or damaging
to the operations of others, so there is no reason, aside from
lack of interest, for it to go away as an operating method.

>3) In amateur bands where spectrum space is not a critical issue, the
>more efficient data modes are certainly preferable. No one is arguing
>about that. I know the numbers as well as anyone.

And in bands where spectrum space *is* a critical issue, more efficient
modes are even more important because they allow greater occupancy
and sharing of the spectrum with others.

>4) The problem lies in the HF CW bands, which are narrow and are often
>crowded, especially during contests and during DXing activities. There
>are some who have a certain disdain for these activities, but I couldn't
>care less about that. For example the 20 meter CW band is only 100 kHz
>wide, and half of that is occupied by data stations (which is OK).

Carl will probably ping you vigorously about the "HF CW bands" phrase.
I know that you mean the portions of the data segments of the HF bands
where CW has been traditionally used, however, and won't make an
issue of it. But I will note that we can go narrower with some digital

modulations and codings than we can with OOK Morse, so if packing them in like sardines is what you want, that's the way to do it. But we have to lower the data rate down near that of OOK Morse to do so. And that's just what VE2IQ and his gang are doing.

But there are other ways to multiplex use of scarce spectrum than by going narrower. Especially for things like working Dxpeditions where speed and number of contacts per hour are important, use of relatively high speed digital techniques in an ordered TDMA que is much better, and much less chaotic. This does require cooperation, however, something often lacking on the HF bands.

Or, use of SS technique can allow us to share the spectrum in a more efficient way while also giving us another tool to deal with severe multipath problems. The spreading bandwidth is too small to give us huge coding gains at HF, but other attributes of SS still make it attractive as an alternative to packing narrowband signals into a slice of spectrum as densely as we possibly can. The latter requires an extremely high, and very dynamic, degree of operator cooperation, which as noted, is often lacking on our HF bands. SS maintains packing density automatically by maintaining a flat spectrum across the band, so less overt operator cooperation and coordination are required to maximally exploit the available spectrum resource.

>5) In this scenario, it is vitally important to restrict bandwidth as
>much as possible, just simply because it is a precious commodity. Let me
>give you an example of what I mean. At one time there was a very similar

>HF bands and also because it was easier to receive (phase coherent
>detection not needed). Since that decision was made there has been very
>little looking back, at least as far as the HF ham bands are concerned.

Yeah, 3 db isn't worth a doubling of occupied spectrum. But if the coding gain were 20-30 db, as it can be with some digital techniques, *then* the issue is much different.

>8) The approach that I and others are advocating is to **OPTIMIZE**
>Morse code usage as a desirable alternative to eliminating it, for the
>very precise reason that in the crowded HF CW bands it makes a lot more
>sense than the wider bandwidth alternatives. If you listen on 20 meters
>or on the commercial/military frequencies you find that a data station
>takes up much more spectrum than a CW station. This illustrates the
>problem very clearly. A high speed data stations completes a message
>faster, but creates wideband interference. A CW station takes longer but
>creates less interference. The wideband interference is a greater
>problem, in practice.

See above. Data stations don't *have* to be high speed. When you slow the rate, you also reduce the necessary occupied bandwidth.

There's nothing unique about OOK Morse in this regard. And an *ordered* TDMA arrangement can make high speed data stations more spectrum efficient as well in certain applications, like working Dxpeditions. Those may spread OOK Morse (or SSB) stations over a 10 or 20 kHz bandwidth, all calling at once. But a single 1 kHz channel, operated in an ordered TDMA fashion, could accomplish the same task in the same time without the chaos and wasteful spectrum consumption of the more traditional methods.

Note that Dxers might say such operation wouldn't be as much *fun*. That may be true, but then they'd likely say the same thing about your machine Morse scheme too. In either case, you're removing some of the macho feel from the operation. Unless you are actively designing or building them, more advanced techniques don't have the "gut" appeal of the more hit or miss methods for people who Dx or contest. That'll likely limit their application to non-Dxers and non-contesters. I don't think the Dxers and contesters will complain if that leaves more spectrum free for them to use.

>9) There are those who have examined the bit error rate vs S/N ratios of
>the various waveforms and have made up their minds, no arguments
>allowed. Numbers are numbers, right? Wrong! What I am telling you is
>that this is not good engineering or good science unless it also
>considers the realities of the *channel* and the *spectrum* that is
>being used for communication. The *real* experts deal with these
>realities every day of the week. The simplistic answer is to ignore all
>of these bothersome details.

Now *this* requires a touch of heat. It would appear that the *real* experts have unanimously chosen to discard OOK Morse as a way of dealing with these realities. They've looked at *all* the numbers, which *do* consider the channel and the aggregate spectrum utilization as part of the equation. And those numbers don't favor OOK Morse. You're slipping away from that disclaimer you made at the top of the post again.

>

Simple, the telephone companies (and cell companies) try to treat telephone conversations as 4 wire circuits as much as they can. That is, microphone signals travel on 2 wires, and earpiece signals travel on another 2. At your central office, they combine the microphone and earpiece paths in a device called a hybrid and connect them to a 2 wire circuit that goes over the telephone poles, and eventually to your telephone. Your telephone has another hybrid in it that combines the 4 wire circuit in your handset and connects it to the 2 wire circuit that comes down from the pole. Microphone signals travel down the wire towards the phone company, and earpiece signals travel down the wire towards your phone.

In a perfect world, the hybrids would do a perfect job of splitting the microphone and earpiece signals, and you would never hear both sides of the conversation when listening in on a cell phone signal....However, the world of cheap telephones is anything but perfect, and the hybrids in cheap phones generally reflect alot of the signal intended for the earpiece back towards the phone company. This is called echo.

Now I can hear you thinking: "If the hybrids are so bad, why don't we get feedback in our telephones?" Well this concerned the telephone engineers of yore as well, and what they did to reduce the effect of this echo is make the signals coming from the telephone microphone 20 dB louder than the signals going to the telephone earpiece. This makes any signal, intended for the earpiece, that echoes off of the hybrid way more than 20dB quieter than the microphone signal. Back in the old days of noisy lines, this loss all but assured that the echo couldn't be heard. Now days with "you can hear a pin drop" lines, you can easily

hear the echo.

"What do you mean I can hear the ECHO...Echo...echo...echo.......?"
Well, you would hear the old grand canyon style echo if the lines
between your house and the central office were really really long, but
because they are short, all you can hear is a phase distortion that
makes your sidetone sound a little bit "big", but that's another story.

Hi. I'm looking for as much information as possible on a 2.4 GHz radio ethernet bridge w/ a 2-3 Mps bandwidth. The 2.4 GHz is the frequency. I'd REALLY like to build my own, but I need design plans and what-not to do this. Any help would be appreciated. Thanx.

Do you actually have to have a machine on both ends?

(actually you do, but the machine on the sending end can be as simple
as a standard keyer -- something that can be implemented with a
dedicated microcontroller or a handful of logic gates, something that
can be built for maybe $30 here in the U.S., as opposed to at the very
least 10x that much money for a minimal system using any other data
mode)

Marijan, it would be very interesting to hear more about your project!

Why does the congresscritter receive protection from prosecution because
it was played on the floor? If he blows someone away on the floor is
he protected from 1st degree murder charges?

The congresscritter also gave a copy to a newspaper. That certainly
shouldn't be a "protected" action.

Anything spoken or read from the floor of congress is protected
speech. Killing someone on the floor of congress isn't
protected...unless
maybe some liberal lawyer tries to equate it with an act
of speech :-)

Whoa Doug, that same $30 microcontroller can, with a little help from a single-chip FSK decoder, do the reception. The microcontroller in most modern transceivers could certainly do it. Except for the display, I have no idea why transceiver manufacturers have not implemented FSK reception in addition to FSK transmission.

The base station (cell) transmitter transmits both sides of the
conversation. Like an ordinary landline phone adds a bit of your
side to the earphone output (Buzzword: sidetone). My guess is that
is also helps by indicating the quality of the link to the cellphone
user.

>will be correct, of course.
>

Often, if you're trying to squeeze the maximum amount of info into a channel, the code lengths *aren't* uniform. An excellent example of this is real-time video compression, where the goal is to send the maximum amount of info with as little redundancy as possible (Huffman coding of DCT coefficients, with as few FEC redundancy bits as possible, for instance). Block interleaving can minimize long burst errors - the penalty here being the additional delay introduced when interleaving/de-interleaving the FEC blocks. But if errors overwhelm the FEC, you are left with complete and utter garbage until you resync.

I find it amusing that a practice that started up because some people could decode characters by ear is continuing over radio. In case people forget, the line telegraphy was originally supposed to be decoded by eye rather than by ear, but because of poor implementation of the scheme, the individuals who could decode by ear were faster at the time. I personally am more interested in communicating than in emulating a machine decoding something. I don't decode packet bursts, rtty signals (ok, I still have a pretty good idea of what ryryryryryryryryryry set at 45 baud sounds like), pactor, and I don't try to decode voice on an oscilliscope or similar device either.

The same thing has been done for years with Baudot RTTY, and
especially now with K6STI's program which uses what he calls a
"numerical flywheel". It pulls signals out of the noise like magic.
And of course RTTY runs at 60 words per minute, far faster than most
of us can do CW. Put aside the key for a while and grab the keyboard.
You'll be pleasantly surprised.

Source record: 90125

Hi,

I need to find the right width for 50R microstrip, depending on the Dk (er) of the board and the thickness. I have come accross tables, but they are really hard to extract an exact value. There must be a formula around, right ?

Also, how can I compute dimension's for on-track inductors, typically one with greater tahn 500R impedance at x frequency, to inject DC into a coax.

Does anyone use Genysys ?? Any good ?

And (I like value for money :-) what is a good material for microwave boards, between FR4 and PTFE at a reasonable cost ?

# 3502. SB-200 Choke Fire

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-11 00:00:00 UTC
From: k3ky@juno.COM
Message-ID: <19971011.065718.7014.1.k3ky@juno.com>
Source record: 90126

There was someone who posted a message about burning up
the 45uH choke in his SB-200 a second time. I hope I am putting
this on the right reflector, as I'm trying to remember what was
going on a week ago. In the meantime, I have had time to think
about the message I posted in response, while I waited 5 days
or so for my computer to get worked on. I had suggested that
the choke fire might have been the result of a parasitic oscilla-
tion 'event'. I didn't have my brain in gear at the time. Parasitics
will destroy or damage tubes, meters, bandswitch wafers,
bias zeners, and plate tuning capacitors (usually just arcs but
doesn't wipe them out.) I don't believe they will ordinarily wipe
out a plate choke. The 45uH choke in the SB-200 refered to here
*is* the plate choke, right? I haven't had my hands on an SB-200
or it's schematic for at least a year, so again, I'm relying on my
memory. Anyway, I believe choke fires are more likely to be
caused by operating too near one of the series-resonant freq-
uencies of the choke. Some chokes have no resonances below
30MHz, and so are pretty safe in any 160-10 meter amp. The B&W
800 choke and the choke used in the SB-220/221 are both exam-
ples of this, I believe. Some chokes, however, were designed
in the old (pre-WARC) days, and happen to have one or more
resonance parked between the higher HF bands, say at or near
18 or 24MHz. If you try to use an amp with such a choke on a
WARC band and it happens to fall near one of the choke reso-
nances, high RF current passes through the choke to ground
and the choke fries. In addition, it is equally possible that some-
one could have such an incident and then rewind the choke so
it even has resonances that fall in one of the traditional higher
bands (20/15/10.) The answer to both problems would be to
get a dip meter and check the new choke for resonances
while it is mounted in place and with a temporary short across
it. I have seen some good descriptions of this simple procedure
in an ARRL publication somewhere. An exact replacement choke
should be carefully checked for any resonances on 17 or 12
meters before operation is attempted there, and a field-rewound
choke should be checked at every HF frequency. The homebrew
choke, even if an exact duplicate of the factory choke, could have
very different electrical characteristics due to a difference in
the insulation film on the wire, winding technique, etc. Of course,
the grid-dipper check of the plate RFC is performed with the amp
off, unplugged, and the HV supply fully discharged! 73, David

The dash has a spectrum three times narrower than the dot, but it must
share the same receive bandwidth as the dot before demodulation. So
the dash suffers a SNR penalty from not being in a matched bandwidth.
If we treat the dash as being 3 conjoined dots instead, we can approach
a matched bandwidth condition, and achieve a higher effective SNR
before detection. That in turn means our slice demodulation will be
more precise, and we'll recover better edge timing information to be
used in the decoding process.

Yes, we can use a loose DPLL, or numeric flywheel as Beezley calls
it, to maintain rough synchonization during periods of no signal energy.
weighting the timing pulses to it based on recovered signal strength will
reduce wander. This is also a useful technique for dealing with fully
voiced modulations in the presence of fading. We can view OOK as
a system with frequent very deep fades for this purpose.

>> If we reach a dead end, IE an

>sequence, like some other data guys do, if there is a break longer than
>say 10 dot + space lengths. A manual operator will also recognize this.

I'm not sure what you mean. Are you saying to send a special termination character? If so, we have to do a correct decoding of that character to act on it, and we must avoid doing an incorrect decoding of something else as the termination character. Absence of signal for a number of character periods should be a sufficient indication to dump the matrix, and avoids the possibility of incorrectly identifying a special termination character in the middle of a sequence.

Dumping the matrix prematurely reduces the probability of correct decoding, but we have no choice if no further characters are coming in to fill the matrix. The sending operator cannot know if our decoding trellis reaches a dead end, since that signifies a decoding error. So he won't know to send us a special character in that case. In that case, we have to backtrack and try another path through the trellis to find the correct decoding solution. If we can find no correct path, we choose the path with the highest metric because that will have the fewest errors. Our decoding won't be perfect, but perhaps the operator can correct it from context.

>Also, take advantage of one of CW's greatest assets, full QSK break-in.

>receiving machine can recognize, which is what operators often do.

ARQ? Yes we could do that, but we first have to determine if we have an error or not. In some cases, an error will be obvious, IE there is no valid path through the trellis. But in some (probably many) cases, there will be a valid path through the trellis, but it could still be the wrong path, IE there may be several paths through the trellis for a given bit pattern corrupted by noise because Morse is a variable length code. We can't be sure which one is correct. So we need a checksum or CRC transmitted if we want to do ARQ. This isn't so alien to Morse ops since in traffic handling we include a check count with the message for this purpose.

But now we have to problem of reliably detecting the location of the check count. With a variable length code, it won't be at a fixed location. I suppose we could define it to be the last two characters before a termination pause. Since the trellis is carrying a history for us anyway, it won't be hard to do a look back for this purpose.

But because a termination pause gives us the weakest decoding, we'll have a higher probability of decoding the checksum incorrectly.

We have the same problem if we send the check count at the beginning of the message. We need to send it in the middle somewhere so that there are characters before and after it to fill the matrix. But then we're back to trying to locate it. Bummer.

Perhaps we should define a convention that we will follow the check count with a series of BT characters. This will fill out the matrix for us, and also serve to locate the check count. Then when the termination pause occurs, we won't care if the matrix is flushed because we'll already have the information we need.

This is getting clumsy for the manual operator. I still haven't quite figured out if you expect this system to interoperate with manual stations or not. If so, we can't make the protocol too complicated. If not, then we can deal with it since computer memory and processing power are cheap.

>- Jeff, WA6AHL

Yep, that's the truth. But that isn't the sort of coding we'd choose
for best accuracy in a weak signal environment. There's always a
tradeoff between accuracy and maximum throughput. There's no
free lunch. For realtime video, we tolerate the possibility of catastrophic
errors in order to achieve timely delivery, IE late video is as bad as
corrupt video.

If we aren't so critically concerned about timely delivery, however,
use of a punctured code can almost give us a free lunch. In that
case, we only send enough bits so that the FEC can recover the
message if there are no (or few) channel errors, and send further
bits (allowing the FEC to recover from more errors) only if we
don't get an ACK from the receiver. That way, we send the fewest
bits possible while still ensuring accurate delivery.

While I like morse code and the fact that is has some efficiency, I do have to admit that some of the digital modes are quite efficient. I had to pass the 20 WPM code test to gain the "extra" priveleges, but I don't think we need to hold to that standard for licensing forever. Perhaps for some sub-band priveleges (as extra class licensees have in the U.S.), but why insist on it just because we had to pass a code test?

I will always love CW and everyone will admit that you can transmit pretty far with very few watts (or milliwatts) and the equipment, if built from scratch, can be pretty simple. But, not everyone likes this mode. Some of us will always love it, just like many (like myself) like antiques. The idea of a CW-only sub-band doesn't seem so bad. In fact, it could actually be a benefit for us CW advocates.

I don't have enough technical expertise to argue that CW is more efficient or the digital modes. If we consider time as well as bandwidth (space), perhaps the wider bandwidth of some of the digital modes is made up for by the shorter time for a QSO needed?

There will be a declining of interest in CW, whether we like it or not, because it takes discipline to learn it to pass the test. Of course, after learning it, anyone could use a computer to do all of the mental deciphering for them, but it still would take some effort to pass the test.

Perhaps an exclusive sub-band for CW only wouldn't be a bad idea after all? ANd, why require a code test for it? People could learn it if they wanted to, or just avoid the sub-bands for CW. Maybe it could be for the exclusive use of just extra class licensees? I say that, because it is no more fair for that to be than to require code testing of anyone above technician no-code class, in my opinion. Almost everyone uses the other modes. Yes, I like CW, and would like to see it preserved, but why? I'm not really sure, but I don't want to see it forced on others just because it was forced on me to get my first licence. Yes, I learned to love it, but not everyone does. Many people who get the novice license allow it to lapse. Are we gaining anything here?

If amateur radio becomes an exclusive privelege to a minority of us, than we face extinction of our bands from less use as CW dies out. Perhaps CW will never really die, but maybe we have to "move over" to allow other people to share our bands. We don't own them, just use them. Let's do what we can to keep them.

>"CQ contest"!

But you seem to be missing the corrolary to more bits per kilohertz, and that is that if you only have a few bits to send, you only need to use a very small fraction of a kilohertz to do it. BPS/kHz is a ratio that applies at all scales. That means that you could have several stations calling CQ in the bandwidth required for one OOK Morse station to do so. The reduction in required bandwidth also can mean a lower required transmit power to get the message through. That translates to less adjacent channel interference.

Or it can mean that you occupy spectrum for less time, thus giving others access to the frequency, IE TDMA. These things may not benefit you much, but they do benefit others trying to use the spectrum. It is the time-bandwidth product which determines the packing density you can achieve in a given spectrum. Narrower and slower isn't always the best answer. Sometimes wider and faster is the best answer. But in either case, BPS/kHz is the metric which tells you what is going to allow the most people to use a given slice of spectrum.

How about a yagi or quad beam antenna? Front to back rejection can be varied somewhat at the expense of forward gain. They are simple to construct and can be purchased commercially also. If you need a wider reception angle, another antenna with less gain, a diplole, or even a 1/4 wave antenna could be used just for reception. The ARRL handbook, as well as the equivalent from RSGB (England) and some otheres, like Bill Orr's VHF/UHF antenna book are good guides for building all of the commonly used types of antennas for VHF/UHF. If you can find "VHF for the Radio Amateur" by Frank C. Jones, W6AJF, published in 1961 by CQ Magazine, there are antennas for frequencies from 50 Mhz to 1296 Mhz. (VHF/UHF distinctions were blurred back then.) I made a 4 bay yagi array with a rather unique fed system I've not seen anywhere else that really put fire in my portable 2M tranceiver. You might not find this in print anymore, but there are plenty of books that can help you decide and design your own solution to your problem.

Cecil, I would submit that paying $30 for a microcontroller is getting hosed
..
the cost and complexity involved with systems that can do much better than
Morse is CONSISTENTLY pointed out as a "barrier to acceptance" and is
grossly exaggerated by the same folks who spout the "Morse will get through
where nothing else will." and "Morse is the best mode for narrowband
operation."
falsehoods ...

I am interested in purchasing a used HF xrcvr rig. I m looking
for at least a triple conversion receiver one. All bander of course. I am
willing to spend upwards of $1000. I am currently looking at a Kenwood
940SAT and an Yeasu 757. Are both of these bases and have their own power
supply?? Do these have 6M also. I don't care about digital. Can u recommend
a GREAT H.F. rig base (with internal power supply)? How do the 940 and 757
compare? Any other suggestions? I know that ICOM makes a model 706 (I and
II) that are H.F. xrcvrs with both 6M and 2M, but it is a mobile. Is there
any Base H.F. rigs that cover 160-10M with 6M also (2M is not that
important now as I would like to get a separate 2M base after an H.F.
base). I hear that Kenwood , Icom, Yeasu all make top of the line equipment
but the tech and general support from Kenwood is severely lacking... I am
perfectly willing to purchase an older unit such as an FT101 or something
similar but I don't know what all those older radios do nor any of their
specs. Is their a book that has pictures of all those old radios and newer
ones to with general specs? I would pay lots for a book like this. It may
sound silly to say but aesthetic do mean something to me, to the respect
that I want a one piece base unit not separate speakers, power supplies,
tuners, and separate VFO's, etc.
Please help me if u can thanx!

I have the following for sale

O-5000 volt at 1 ampere DC power supply. Peter Dahl transformer
Cleaning out my shack and heavily downsizing the hobbly.

1-5000 volt meter, 230 Vac Front Panel Variac, Very High quality
Bleader resistor and series output resistor to protect finals.
Dual circuit breakers, In heavy metal cabinet with roller. Professional
Built at a cost of over $1200. Has internal relay to remote start and
10,000 Volt relay to contact bleeders when de-energised. Heavy duty
Square D panel lanps and on-off switch. $450
HP 430C with with bolometer in very good condition $145
These are very hard to find with a working bolometer

Simpson 260 with mirrored scale, Very good condition $70

Bencher Paddle, Very good condition Black and Chrome $40

William Nye Straight Key $20

Amp Supply Co AT1200 Antenna Tuner, 1200 Watt Very Good condition $80

Shure Brothers 444 Mike Good Condition $20
Jenning 3-30pF , 15KV Vacuum Variable Capacitor
Extremely nice cap $50

The following New in the box Panel Meters:

2 - Modutek #725DMA001 0-1 Ma $15 each

1 - 200-0-200 uA Modutek #15DUA-200 1 1/2" $15

1 - Modutek 0-50 uA, 1 1/2 " same as above $15

1 - General Electric #2513 300-0-300 DC Volts $12

1 - Simpson 1 1/2 " 0-50 uA Beautiful meter $18

2 - New Ceramic Variable inductors by Lapoint Ceramic 10uH
Very nice $22 each

1 - SK620A Eimac Socket and Eimac SK606 Ceramic Chimney
New in the box (both) $35

1 - Eimac SK800B socket for 4CX1500 or 4CX1000A Modified and ready
for the 432 Mhz amp in the Handbook. (I never finished the
project) $75

1 - Millen #12551 Variable Capacitor , New 50pF, approx 1500 Volt
$15

1 - EF Johnson #154-505-4 like new dual gang 50pF, (100 total)
HV Transmit capacitor $18

1 - Miller Transmitting choke 1.5uH #4535 pi-wound Beautiful
$12

1 - Eimac 4-1000 air system socket used in good condition.
Removed from equipment $20

3 Slightly used and tested 6LQ6 sweep tube $15 each
RCA These have had little or no use, they look nearly new.

1 - Jackson Brothers Dual- Speed Dial drive , new
4 scales 0-1.0 and 3 blank this is a really nice
drive for a receiver $25

1 - Jackson Brothers ball drive and dial, New , Round , Type C
Approx 4" in tattered box $15

1 - Collins used modulation transformer Model 677N201
20 watt 6000 ohm primary, 6000 ohm secondary
3000 VDC Max WV Good condition $25

1 - Hamtronics R451 Receiver , Very good condition
crystal controlled , with one crystal, Have no equipment to test
but looks very nice, designed for use as a repeater Receiver
Never used after assembly $50

Hi
the practice is here:
TUNE the RX to 144.300 or 144.050 (Standbye frequencies) when no
activity, and monitor the frequency, you will soon know when condx
starts, 144.050 is perhaps the best calling frequency for aurora condx
Lot of calling is every day on 144300.

The pencil lead was "NOT" on the sharp edge of the razor! The point was
placed on the blue-blade side. The anodized surface acted as a
"simi-conductor".... Sparks W4EAS

>Dave W9VI
Well, assuming that the IC751 is the same. Sounds like the PLL is out
of lock. Check for 6.5 V on R46 @ 7.9999Mhz mode LSB General. Adjust
C78 to get the correct voltage measurement. Says in the service manual
to use an oscilloscope but a digital volt meter -should- ( haven't
tried it so might be wrong) work if you don't have one. Or if you
don't have a meter, try tweaking it so that your receive comes
back-checking to make sure that it works in the whole band from 100Khz
to 7.9999Mhz.
C78 adjust for 6.5V @7.9999Mhz
In case you also need to adjust for the next 3 bands.
C88 adjust for 6.5V @14.9999Mhz mode USB General
C97 adjust for 6.5V @21.9999Mhz
C107 adjust for 6.5V @ 29.9999Mhz
Confirm measurements by checking for 3V at 8,15 and 22Mhz.
Look for the PLL board, the large square metal can toward the back of
the radio has the adjustment points in it. There will be 4 holes in
the top to access the adjustment points. The hole closest to the front
of the radio is C78, the next one behind it is C88, next is C97, next
is C107. R46 is on the left side of the metal can containing the
adjustment points and a little less half way to the middle of it.
Marked on the board so should be easy to find. The PLL board that you
are looking for is found by taking the bottom cover off of the radio
and it will be the board to the right hand side as the radio is upside
down with the front facing you. That is my opinion of what needs to
be adjusted- hopefully it will help. I had the same problem once and
that did the trick. Actually I did a full alignment but that was the
adjustment procedure that was out of whack.
-Dave

>they are really hard to extract an exact value. There must be a
>formula around, right ?

There are several, with varying accuracy. One which works well for FR-4
and PTFE at roughly 50 ohms is:

Z0 = (87/sqrt(er + 1.41)) * ln(5.98h/(0.8w + t))

where

er = dielectric constant of the board material
h = board dielectric thickness
w = trace width
t = trace thickness

h, w, t can be in any units, but must all be in the same units.

This is from the Motorola MECL System Design Handbook.

More complex formulas that are more accurate for much narrower or wider
lines, and for higher dielectric constants (like the 10 of Alumina and
GaAs) can be found in "Transmission-Line Properties of Strip on Dielectric
Sheet", Wheeler, MTT-25 #8, Aug. 1977, p. 631, or _Computer-Aided Design of
Microwave Circuits_ by Gupta, Garg, and Chadha.

Well Bill, I will argue about that. I am capable of running most of the more efficient data modes but I simply prefer CW for ragchewing. Quite often, I run 5 watts when I could be running 700 watts. I don't need to transfer a lot of data and, for me, CW is simply more fun than PACTOR. CW is not a problem. It should be one of the modes that hams are free to choose. There's very little difference between PACTOR and internet with its email and chat modes and internet is usually a lot more reliable. Why can't we all just admit that each mode has its own characteristics which are morally neither good nor bad. Each mode has its place. There's nothing wrong with CW. There's nothing wrong with old modes (except spark). There's nothing wrong with new modes. The only "wrongness" is the incessant bickering. Modes, like activities, can be chosen for no other reason than for fun and that's perfectly OK. Some hams own only one HF rig, a QRP CW transceiver. Let's be careful in our fervor for efficiency that we avoid using the force of the federal government to enforce greater efficiency. The preferred modes will win out and I'm not sure the winner will be the most efficient mode unless we are forced into it (which is a wrongness).

There isn't much 2m SSB equipment available, so most operation is on FM
where even a simple 2W handheld can yield good results, there are also
many repeaters around that allow contacts quite far afield.
2m Packet (digital) is very active throughout the UK. Here in the West
Midlands I use a handheld driving a 30 Watt Amp for packet radio. Best
suggestion is to get in touch with your local radio club, the Leeds and
District Amateur Radio Club for which I don't have details to hand, but
there is also Halifax and District Amateur Radio Society, Tel. 01422
202306.

Here's my two bits:
1) consumer microwave oven transformers have poor regulation. However, they may be good for low power at a high duty cycle, ie my microwave oven used used for up to 30 minutes at a time !
2) I have an article for a 500 W linear using a microwave oven transformer, from a '96 CQ magazine written in Japanese.

3) If you need a big transformer, check out ultrasonic welding equipment. I understand that they typically use big(2kW) or so HV transformers. I have another article that uses one such transformer to build a 2kw linear with a 8877

You'll find a formula on page 24-25 of the book: Reference Data for
Radio Engineers. I don't have the actual formula, I just have a
photocopy of the next page with an experimentally determined graph. The
top of the page I've got refers to h=dielectric thickness. w=width of
strip, eta=dielectric constant and mu=permeability.

According to the ARRL UHF/Microwave Experimenter's Manual, you'll also
find formulae in the Dec. '77 issue of, the sadly defunct, Ham Radio, in
an article by Jim Fisk. What became of him, by the way?

Mario, the async nature of hand sent Morse can be a problem, but the bigger problems are the non-uniform nature of the Morse symbols, the fact that with OOK 60% of the symbols are unvoiced, and the variable length of the encoding. When you add all of those together, you have a mess.

I notice that Cecil gave you a good answer to the machine to machine scenario. If you're going to do that, then you should go ahead and use a better modulation and coding. The only reason it makes any real sense to me to attempt to do machine Morse is to interoperate with *manual* operators. So you must design the system to accomodate the variability that they insert into the process.

Bill,
It's nice that you answered these guys, but odds are they're
no-code techs. Most new hams are. They probably
want a 2m FM transciever. A direct conversion unit ought to
be as simple as a variable source, a VFO, a mixer/detector, and an
op-amp. Problem is...all the "build it cheap and quick" articles
_are_ for the 40m CW crowd! Show me/them _one_ schematic for the
above unit, with cheap, exact, current, part numbers.

Wasn't there ten amendments to the original Constitution?
If so, then if a member of Congress breaks the Constitution, what
recourse do we Americans have?
I'm not sure , but I'd assume the CONSTITUTION wouldn't protect
members for their official
violations of our God ordained rights.

BTW, The Constitution isn't worth the paper it's written on.

Source record: 90027

Can anyone tell me what the CW output of this radio should be? Mine used to put out 100W+ (I'm sure) but Kenwood seems to think 80W (which I get now) is within spec. I've replaced the tubes, reneutralized and even sent to Kenwood who said its OK. It does about 220 ma at 800V according to the meter in the rig. I get about 120W Peak on SSB. I'm using two different and good power meters that more or less agree.

If it should do better, any guess as to what the problem might be?

Thanks
Bill

PLL design is really not a great thing to tackle if this is your first receiver project. You can get some bssic information on their theory and operation from the ARRL handbook. If that doesn't convince you to run screaming in the other direction, the next reference to look at would be the PLL synthesis books by Ulrich Rohde and Roland Best.

Sams used to publish a good introductory book by Howard Berlin called "Design of Phase-Locked Loop Circuits with Experiments," but I haven't seen it in stores for a long time. www.amazon.com may carry it, or be able to get it. This book doesn't go into RF synthesizer techniques, but is an excellent introduction to the basic principles.

For casual shortwave experimentation, I'd take a look at the line of direct digital synthesis (DDS) chips from Analog Devices (www.analog.com). The AD9850 in particular would make a great VFO for a general-coverage HF receiver project. You could easily run it with your PC, or build a dedicated controller based on a Basic Stamp or something similar.

Hi Ian
I once paralleled two switching supplies for a system I was building until I could get a large enough supply. The two supplies were connected to either side of the back plane to get as much isolation as possible. It worked ok for digital, but looking at the voltage, every now and again there was a strange fluctuation in the voltage that I interpreted to be some sort of lock-in beating between the switching frequencies of the two supplies. When the correct supply arrived, I put it in and looked no further.
So its possible, but be aware.

## 3549. Looking for VHF amp engineering advice...

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-12 00:00:00 UTC
From: kr4wm!@sccoast!.net!
Message-ID: <MPG.eab2d7cacd4f64198968c@news.infoave.net>
Source record: 90033

OK, so I'm cheating by starting with a Motorola repeater
power amp! I recently picked up this amp which uses two
8560AS tubes. I've looked all over for a model number,
but none has presented itself. Anyhow, most of the info
I need is probably generic in nature.

This amp has a single 1P2T coaxial relay, a Magnecraft
#128 X-62. Is this common enough and cheap enough that I
could obtain another? I'm supposing I need two of these,
with interconnecting cables. Alternately, is there such
a thing as a 2P2T coaxial relay? How much should I expect
to pay for a relay for this application?

There's no plate/grid current meter, so I how will I be able
to tell when the plate(s) are properly dipped? Should I simply
load for highest power? Should I try and design a plate
current metering circuit? Do I need to monitor grid current?

There's no volt meter. Other than showing a potential problem,
is it necessary to monitor plate voltage? I could do this easily,
as the plate supply has a separate lead.

I plan on using this amp mostly for SSB, so would like to
set it up for class AB1. It's my guess that it's class C now,
because it was in FM repeater service. There's a screen voltage
adjustment on the front of the amp. Is all I need to do simply
to set this control properly, or is there something else I need
to do?

I don't anticipate large frequency excursions, maybe from 144.150
to 144.250. I _may_ use it for repeaters only in an emergency.
Is anyone familiar enough with the Motorola repeater amp designs
so that you could tell me if I'd risk exploding something by not
retuning the amp when moving from 144.2 to 147.72? The controls
for tuning this amp are: grid tuning, plate tuning, antenna
coupling, and antenna matching. I'm assuming that proper procedure
is to touch them up in that order- correct?

I probably should think of something else, but right now I can't.
If you can think of anything I haven't considered, I'd appreciate
a heads-up. This thing is too nice for me to mess up. It's clean
as a pin- no dust/rust/mouse droppings. Looks brand new. I was told
to expect about 400 watts out, but I'm guessing it'll do much more
than that on SSB. The plate transformer is HUGE!!! From the insulation
on it, I don't think it's more than 1000 volts, though.

Anybody ever mess with one of these and been where I'm headed?

Thanks for any advice- 73 all, Web Williams in Myrtle Beach, SC

I've just checked the small Yagi I use for 2 m SSB, and the VSWR is over
3:1, which is one reason why I'm not hearing very much. It was 1:1 when
I put it up.

Hi John, actually PLLs are easier to us as a local oscillator than DDS chips because PLLs tend to be a lot more linear. It is much harder to get rid of spurious responses with a DDS chip than with a PLL. Motorola had some pretty good application notes on PLLs last time I checked.

100LPM cw is 16.6baud - about 1/3 of RTTY speed
an optimal cw rx system may have some signal/noise advantage over
RTTY, or you may use some lower power. CW signals occupy less
spectrum, more amateurs may be QRV within a bandsegment using cw than
RTTY

because of the low power needed the use of CW may have an
environmental advantage, too

By the way, is still the mainline TT/L tube type TU (QST 1964?)
expected to be the best?

Larry: Go for it! You can definitely do it. Be careful in selecting your circuit. Look for something simple - nothing exotic or experimental. Take it one step at a time. If you have never built anything before, you might want to start by building a simple crystal controlled CW transmitter. Next step up might be a simple Direct Conversionn receiver. With one of these you could listen to HF CW and SSB QSOs and you could pair it up with the transmitter mentioned earlier. Later, you might want to build a simple Superhet Receiver.

But a lot of books. The ARRL has an excellent selection (Solid State Design, QRP classics etc.)

Be persistent. Don't give up if you don't succeed in your early efforts. Consult with more experienced hams (here or in person) if you run into trouble.

Good luck! 73 Bill N2CQR

>swill on the rest of us, it legitimizes their actions.

Some people have, however, suggested exactly what "JS" did.
Difference being, that under their plan *all* ISPs would charge per
byte*addressee received. So if I sent a 1000 byte message to
jstrohm@taxes.net, taxes.net would charge telalink.net 1000*1*0.01, or
10 cents; presumably, telalink.net would in turn charge me that 10
cents. If I sent the same message to 10000 addressees, taxes.net
would charge telalink.net 1000*10000*0.01, or $1000. If telalink.net
didn't pay up, taxes.net would reject future email from telalink.net
users. Again, presumably telalink.net would pass that $1000 charge
along to me.

I do see two other problems in this scheme though. First, handling
mailing lists, where one message is sent to several hundred (or
thousand) recipients *who want it*. Unfortunately, this is
technically identical to spam -- only by analyzing the contents can
one tell it isn't. Second problem is when someone sends a single very
large message (for example, with an executable binary attached) to one
addressee. Unfortunately, fighting this crap just isn't easy...

Source record: 89971

I thougnt the ARRL QSL buro was primarily a DX buro, and
domestic use was discouraged. The Operating Manual has
up-to-date BURO info. You could also call the ARRL and
ask -- they're pretty good at providing accurate, up-to-date
info over the phone.

If your friend wants to see cards any time this year, he should
QSL direct -- and provide a SASE for domestic exchanges. If
you have never used the BURO, you haven't come to realize that
it should be spelled "burro" because there's this one lone little
donkey that carries all the cards all over the world. Like
Santa Claus and about as frequent, but not as fast because he
can't fly.

No problem with lacquer = lacquer, but in modern usage that doesn't specify what it's made of, or fingernail polish either. The consensus (including several e-mails) seems to be that Krylon is acrylic, which at least fits the name.

>I have fond memories of trying to buy denatured alcohol in Australia some

I was curious and called Newt's DC office.

The couple has NOT been charged, nor fined. Janet Reno is sitting on
this one too!

I have a Communications Concepts (I Believe) PC Board and RF Relay
a Motorola MRF240 RF Transistor, and most of the parts except heatsink
to build a simple 3.5 watts in , 35 Watts out, 13.8 volt 2 meter
amplifier. Included is a Die Cast Aluminum case. I bought the stuff at
Dayton a few years ago and never built the amp.

The amp is based on the Motorola Application Note AN-791 in the RF
Handbook which I can supply a copy. It is a Linear design with RF
Sensing to switch the RF Relay.

$75 including shipping

Omron, my competitor, does business via industrial distributors. I'd call Omron direct and ask them for a sample they'll more than likely send you one if you don't tell them that you'll NEVER buy more than 100 pc : ) If not ask who locally sells Omron, you should be able to find Omron at Granger, Newark and many others.

# 3587. Morse code reception

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-13 00:00:00 UTC
From: "William E. Sabin" <sabinw@crpl.cedar-rapids.lib.ia.us>
Message-ID: <344236C6.1885@crpl.cedar-rapids.lib.ia.us>
Source record: 90048

The purpose of this article is to encourage the homebrew experimentation with methods for improving the reception of weak-signal Morse code on the Amateur Radio bands. The motivations for this are the following:

1) Morse code, also known as on-off-keying (OOK), irrespective of other interests in speech modes such as SSB and relatively complex data modes of numerous types, is still, and is expected to remain, a mode of great worldwide interest in Amateur Radio.

2) Manual CW operation, using very simple eqipment, both transmit and receive, especially low power (QRP) equipment, and without computer (PC) assistance, is easily accessible to individuals of limited technical and financial means. CW has always been the "common denominator" mode in Amateur Radio.

3) CW operation is conducted within very narrow bandwidths, which means that a large number of stations can operate simultaneously within narrow Amateur sub-bands such as the HF CW bands.

4) There are many operators who enjoy the CW mode, and want to preserve it, in addition to the more tehnically advanced modes that are now available.

5) Morse code is a signalling method that can easily be "mapped" from dot-dash symbols to a local language such as English, German, etc. In other words it can be translated mentally by the operator without machine assistance.

From a purely technical standpoint, Morse code has limitations, relative to other "waveforms" such as FSK and a large number of phase-coherent methods. FSK requires two separate frequencies, Mark and Space, usually separated by 170 Hz. This means that conventional FSK usage doubles the band occupancy and requires *two* clear receive frequencies for perfect copy. As an alternate to this, CW mode can be received at slow speed on a *single* frequency in a very narrow bandwidth. And very simple equipment is adequate for this purpose.

In a noise background, FSK is more effective partly because there is always a signal present. CW mode, on the other hand, has to deal with "key up" (no signal) states, in which the absence of signal may imply a fairly high noise level. To the human operator these key-up states are significant information because they "separate" dots and dashes, characters and words. In other words, key-up is at least one bit of information. For example a dot followed by a space (key-up) is a two bit message and a dash is a 4 bit message (A.S. Chester, MIEE, G3CCB, Wireless World, August, 1983). Also, sometimes offsetting some of the

advantage of FSK is the fact that *some* CW transmitter designs are capable of 3 dB more long-term peak power at the 50% duty cycle of CW. It is also true that FSK must also distinguish between the signal on one frequency and the noise on another frequency. This is identical to the CW problem that I just mentioned. Still, at a very low signal-to-noise density ratio (S/N0) FSK offers an additional advantage in error rate (Carlson "Communications Systems", 1975).

Phase coherent methods such as PSK, MSK etc. offer much more improvement. The problems with these methods involve A) the complexity of the equipment and B) the very difficult problem of maintaining phase coherence, especially at HF. This is the realm of truly advanced technology that is not readily accessible to most amateur operators.

In view of these considerations a very desirable goal, from a specifically *Amateur Radio* standpoint, would be an experimental homebrew effort to develop a Morse code CW system that would A) greatly improve CW reception under weak signal and interference conditions and B) permit "interoperability" (buzz word) with CW operators who are *not* equipped with the advanced system, so that *anyone* can copy the CW signal under conditions of adequate signal levels and interference and with moderate code speeds.

How can this be accomplished? There are many approaches that could be considered. One European CW expert reports a German design that works quite well. I do not know how that system works. One basic approach could be to store a number, perhaps 10, of consecutive bits, both key down and key up, and use software decoding of these bits into dots, dashes and the three different space intervals, into alphanumeric on-screen text.

The main exercises are to A) distinguish signal from noise, just as in FSK, and B) to determine dot vs dash and the lengths of the spaces. Part B is more difficult than FSK and requires some special ingenuity, but I am sure it is definitely feasible (do-able).

The approach that I would prefer is as follows (and this is just a first cut):

1) The audio output of a conventional CW receiver is further filtered by a DSP filter with narrow bandwidth and phase linearity (zero group delay). This filter is at 500 Hz and has an adjustable bandwidth down to, say as little as 20 Hz or so.

2) The output of this filter is clocked into a CCD (charge coupled device) or "bucket brigade" with 100 taps (10 taps per bit). The clock rate can be initially set and synchronized manually by the operator, but the subsequent clock synchronization can be maintained by using the kind of "early/late" synch methods that are used in spread spectrum. The clock should have an "inertia" property that prevents rapid fluctuations. These methods are used in many applications. A follow-on project could be the fully automatic lock-up and synch process (not

necessary for starters).

3) A threshold detector distinguishes between ON and OFF. This can be set manually or it can be determined "on-the-fly" by the software, possibly using a preamble of 10 dots. An initial up-front manual adjustment would get things started.

4) Each set of ten taps corresponds to a dot length. Each set is converted to positive-going voltages, and then put through an integrate and dump filter.

5) The collection of ten outputs from the ten integrate and dump filters is then compared with the threshold and 1/0 levels are sent out for processing into text.

6) One important aspect is that 3 contiguous ON states at the outputs of the integrate and dump filters are combined to form a dash or 3 space symbol. This combining is equivalent to an additional filtering process. A method somewhat similar to this is the "Welch method", used in DSP work (Oppenheim and Schafer, 1975).

7) An alternate (possibly better) method would use *parallel* bucket brigades that are set up for A) dot plus space, B) dash plus space, C) 3 spaces and D) 5 space intervals. The exercise is then to process these with some kind of "decision making" software algorithm.

8) The processing could be done with a stand-alone gadget that uses an LCD readout plus a printout capability, or a PC interconnect. For starters, the PC approach would be better.

The final result would be a greatly enhanced capability for Morse code CW that would allow a solid interface with both computerized communication and the human operator who knows how to operate CW. This end result would be a *compromise* between the relatively inefficient Morse ON/OFF system and the other more efficient but more specialized data methods that demand data processing for the human operator.

One powerful tool that CW operators use is the fast QSK break-in mode. This should most definitely be part of the approach, for it allows error correction. This can be manually operated at first, but later on automated. We don't have to do the whole ball of wax at one time, it can be spread out.

I believe this would be a uniquely valuable enhancement of the Amateur Radio Service for this one special reason: the number one thing about CW is that the Morse code can be read mentally or written without any machine intervention, and for Amateur Radio in particular this is powerful. The enhancement in noise and interference adds additional power.

I have a 100% disassembled Dentron Cliperton-L amp minus the tubes. It is about 95% complete (parts wise) including the original filter cap board which needs work. Includes the main power xmfr, plate and filament chokes, plate tuning and loading caps, tank circuit L network, the tank door knobs, band switch, front panel meter, the entire chassis, tube sockets, etc. Does not have the output T/R relay and the ALC circuitry.

This was going to be a rebuild/upgrade project but I have since changed my mind.

Price is $150.00 for everything minus UPS charges from San Diego. A replacement pwr xmfr form Peter Dahl Co. is going for $185.00 minus shipping. My zip is 92139. Buyer pays shipping.

This whole business of "private conversations" on "public" airwaves is
no different than holding a "private conversation" in a crowded room
with both parties shouting at each other from opposites sides of that
room. Silly, in the extreme. How dare the other OCCUPANTS listen!
And then, add the "lawmakers" and "money makers" to the brew.. Thou
shalt not listen to private conversations on public airwaves. It is
insane!!!
The solution is a technical one. The manufacturers can make secure
systems, but IMHO fear a public backlash at the cost. Sheesh. Is there
no end?

Dick

BZZZT!
Wrong answer, but thanks for playing our game, "What's my SPAM!"

Actually, this is EXACTLY what the SPAM-meisters like
Sanford Wallace do. They make the originators of SPAM pay
to send messages out from their gateway. They collect a fairly
reasonable fee, based on the cost to provide this service. However,
it nowhere approaches the cost to the rest of the world -- and since
the SPAMmers pay a service provider to unleash their torrent of
swill on the rest of us, it legitimizes their actions.

Compare it to the Nuclear Regulatory Commission deciding to
get rid of nuclear waste by mailing everybody 100 grams of
plutonium -- then requiring us to pay to dispose of it properly.
The NRC declares it legal and proper, pays for the outbound mail,
and we get burned.

The real answer is to handle UCE as equal to junk faxes, and to
handle forged headers as equal to wire fraud. Give the consumer
a significant monetary recourse in court, and give the various
levels of government a significant incentive in terms of fines
and forfeiture. Only that will end SPAM. And it will end soon
when "Send SPAM, go to jail" is a reality.

Sorry for the off-topic noise, but SPAM is the "rotten QRM" of
the 1990s.

From: hamm4fun@aol.com
Message-ID: <19971013175700.NAA25178@ladder02.news.aol.com>
Source record: 90055

I recently came by a tube soket assembly for a pair of 4cx250's. Thought they may make a nice building block for an amp. They have a built in screen bypass cap which measures 120nf total for both tubes. Apparently this assembly was designed for UHF/VHF use. My question is what is the minimum freq that tthe sreen bypass would be effective. I was thinking about building a 6/10 meter amp. I have figured out a way to augment the existing capacitors but had rather not. I may even cosinder using them in a 2 meter amp instead.
Any help would be gratly appreciated.

[and imposition of government force.]

Yes that's exactly what the code test forever crowd is trying to do.
It is "my way or the highway". We''ve all heard it often enough.
And we've heard the ridicule heaped on those who disagree with
the lodge initiation that this group wants to maintain embedded in
public law as a condition of access to amateur HF frequencies.

What we've heard from the other side is a call for freedom of choice
rather than public subsidy. The merits of various communications
techniques should be judged in free and open competition, and in
free and open debate and discussion. Let the systems which best
suit the needs of particular individuals be chosen by those individuals
as a matter of informed choice, and let the choices of others be similarly
made based on their own objectives and needs without imposition
of government force into the matter.

That's the real crux of the matter. One side wants to win their point
through the use of government force to maintain a subsidy for their
particular methodology. The other side is content to let individuals
make a free and open personal choice based on the merits of the
techniques in question, confident that Adam Smith's invisible hand
will bring them success in the marketplace of ideas.

Women's fingernail polish is the same basic formulation, so if you can find the same stuff in a can, you've got it. Lacquer is a common type of fast-drying paint, so I'm sure you have it there -- once you figure out what it's called. The dictionary says lacquer paint is "any of various clear or colored synthetic organic coatings that typically dry to form a film by evaporation of the solvent; esp: a solution of a cellulose derivative (as nitrocellulose)".

I have fond memories of trying to buy denatured alcohol in Australia some years ago. Fortunately the chemist (which we would call a druggist) was a man of science so we were able to communicate. I never would have guessed "methylated spirit", but once I heard the term it was obvious that was what I was after.

Was it Churchill who declared the U.S. and England to be "countries divided by a common language"?

Try searching Krylon for their Material Safety Data Sheet (MSDS) on
this.
> Was it Churchill who declared the U.S. and England to be "countries divided
> by a common language"?
Actually, I think it was an earlier PM (Tallyrand?) but is usually
attributed to Churchill.
>
> Roy Lewallen, W7EL
Roy is correct, fingernail polish is lacquer. Unfortunately, I think
the UK name for it is different.

The Krylon refered to has no pigment.

A common pigmented lacquer is Japan Black (probably called something
else these days) which in spite of its name was imported from England by
Ford for the Model Ts which is why he only painted them black.
(Eventually, he found a direct source from DuPont which after a few
years found other pigments.) I believe the source was Imperial Chemical
or one of its ancestors.

If you want to ensure privacy get a digital celluar phone and
stay in the cells that support that service. Otherwise you
are simply broadcasting an unencrypted signal over the airways.

Listening to the Police, File, Ambulance, baby monitors,
McDonalds employees, CORDLESS PHONES, and cellular phones is
something that people do. The law has always made revealing
private information illegal. Currently it is only illegal to
listen to an analog cellular phone, not a cordless phone.
Restricting access to scanners and monitors will not greatly
increase your privacy.

I would like to hear from anyone with experience homebrewing
a solid state HF power amplifier, especially at the legal limit
level. I see a lot of postings about tube amplifiers, but
no solid state. Outside of ham radio, I believe that no
new designs are using tubes at the 1500 watt level. Am I
unaware of some reason why tubes are great for ham amplifiers?
Also, is anyone aware of a commercially available ham linear
that runs 1500W PEP output using solid state devices? All
the solid state ham linears I've seen are not legal limit.

You do know that operating a linear amplifer in the 11 meter band is
against the rules and regulations.
You need to read Part 95 of the FCC rules and regulations.

Gary:

Why would you do that to the Extras who value their own "sanctuary"?
Seems they earned it by completing the toughest possible testing.

I'm sure a sub-segment of the existing segment already used by folks for
morse code could be set up as a "sanctuary" for code, free of competing
mode types.

> of numerous types, is still, and is expected to remain, a mode of great
> worldwide interest in Amateur Radio.

You hope ... I believe it will survive, even if forced learning and
mandatory tests are eliminated, but "remaining a mode of great world-
wide interest" is, IMHO a stretch ...

> 2) Manual CW operation, using very simple eqipment, both transmit and
> receive, especially low power (QRP) equipment, and without computer (PC)
> assistance, is easily accessible to individuals of limited technical and
> financial means. CW has always been the "common denominator" mode in
> Amateur Radio.

Some truth, some "feel-good" rhetoric, some mythology ...

> 3) CW operation is conducted within very narrow bandwidths, which means
> that a large number of stations can operate simultaneously within narrow
> Amateur sub-bands such as the HF CW bands.

But MORE stations could operate simultaneously within those same narrow
segments by using more modern techniques that are only marginally more
"complicated."

> 4) There are many operators who enjoy the CW mode, and want to preserve
> it, in addition to the more tehnically advanced modes that are now
> available.

Partially true ... there are also rabid "Morse forever and nothing else
will make you a 'Real Ham'" folks who seem intent on keeping anything
more modern from gaining a foothold in "their" bands.

> 5) Morse code is a signalling method that can easily be "mapped" from
> dot-dash symbols to a local language such as English, German, etc. In
> other words it can be translated mentally by the operator without
> machine assistance.

So? Yes, ALL it does is provide a representation of the (usually
"Arabic") alphabet, nothing more. As far as "mental translation"
the same "attribute" can be attached to Baudot of ASCII at comparable

speeds (if the Baudot or ASCII operators would slowwww wayyyy dowwwn.)
The fact that those other codes are *usually* decoded by some sort
of electronic decoder is mostly because it is trivial to construct
such apparatus and they are capable of operating MUCH faster than
humans can copy by ear.

> From a purely technical standpoint, Morse code has limitations, relative
> to other "waveforms" such as FSK and a large number of phase-coherent
> methods. FSK requires two separate frequencies, Mark and Space, usually
> separated by 170 Hz.

The 170 Hz shift is a "convention" not a requirement ... and that shift
is capable of supporting FAR higher transfer rates than Morse operators
can handle ...

> This means that conventional FSK usage doubles the
> band occupancy and requires *two* clear receive frequencies for perfect
> copy. As an alternate to this, CW mode can be received at slow speed on
> a *single* frequency in a very narrow bandwidth.

FSK can retain "orthogonality" down to tone spacings of 1/2(T) (where
"T" is the symbol rate for coherent demodulation and 1/T for non-
coherent demodulation ... other techniques can result in higher "bits/Hz"
numbers than simple BFSK, but BFSK is probably the simplest to implement
of all of the digital modes.

> And very simple
> equipment is adequate for this purpose.

The transmitter and receiver for BFSK are only marginally more
complicated than an OOK rig and either technique could be used
to transmit/receive Morse ... though far better codes are available
and could just as easily be copied by ear at the slow rates normally
associated with OOK Morse ... there is even a body of evidence, it
seems, that the human ear is more sensitive to subtle changes in
pitch in a noisy environment than subtle changes in amplitude ...
thus it seems that FSK would also have a decoding advantage in
"wetware" not just in hardware.

> In a noise background, FSK is more effective partly because there is
> always a signal present. CW mode, on the other hand, has to deal with
> "key up" (no signal) states, in which the absence of signal may imply a
> fairly high noise level. To the human operator these key-up states are
> significant information because they "separate" dots and dashes,
> characters and words. In other words, key-up is at least one bit of
> information.

Only if the S/N is high enough that you can reliably discriminate
a "space" from a FADE ... holes is holes ...

> For example a dot followed by a space (key-up) is a two bit
> message and a dash is a 4 bit message (A.S. Chester, MIEE, G3CCB,
> Wireless World, August, 1983). Also, sometimes offsetting some of the

> advantage of FSK is the fact that *some* CW transmitter designs are
> capable of 3 dB more long-term peak power at the 50% duty cycle of CW.

Yet that 3 dB due to duty-cycle limitations at best only partly
compensates for the clear 6-9 dB advantage of FSK ... and that
ignores the fact that it's easy to add FEC to the digital signal
with its uniform code ...

> It is also true that FSK must also distinguish between the signal on one
> frequency and the noise on another frequency.

True, but that's trivial for a correlator and an integrate and dump.

> This is identical to the CW problem that I just mentioned.

It is NOT "identical" ... the "unvoiced data" in the CW signal results
in a more sparse decoding matrix, as Gary pointed out the other day.

> Still, at a very low signal-to-noise
> density ratio (S/N0) FSK offers an additional advantage in error rate
> (Carlson "Communications Systems", 1975).

And at higher S/No ratios, the errors in machine-decoded FSK will be
orders of magnitude lower than typical "human error" ... or do you
contend that most human operators can copy hundreds of thousands of
characters of high speed Morse without a single error?

> Phase coherent methods such as PSK, MSK etc. offer much more
> improvement. The problems with these methods involve A) the complexity
> of the equipment and B) the very difficult problem of maintaining phase
> coherence, especially at HF. This is the realm of truly advanced
> technology that is not readily accessible to most amateur operators.

Baloney ... (the "truly advanced technology that is not readily
accessible to most amateur operators" part, that is ...) This stuff
has been well-known for quite a few years ... yes, improvements are
still being made in equipment and methods, but the basics are readily
available in a wide variety of references for all to see and learn.
The problem is that too many people spend all of their time re-enacting
things from the 1920s-->1940s and virtually no time improving their
technical knowledge and skills.

> In view of these considerations a very desirable goal, from a
> specifically *Amateur Radio* standpoint, would be an experimental
> homebrew effort to develop a Morse code CW system that would A) greatly
> improve CW reception under weak signal and interference conditions and
> B) permit "interoperability" (buzz word) with CW operators who are *not*
> equipped with the advanced system, so that *anyone* can copy the CW
> signal under conditions of adequate signal levels and interference and
> with moderate code speeds.

Sounds like a waste of time to me ... but if it blows air up your
skirt, knock yourself out ... just don't try to use it as some sort
of "justification" for maintaining Morse as the penultimate of

radio communications ... 'cause it's FAR from it ...

[snipped long, drawn-out, proposal of questionable technical
merit ... seems like Bill still doesn't understand where the
demodulator stops and the decoder begins ... oh, well ...]

> I believe this would be a uniquely valuable enhancement of the Amateur
> Radio Service for this one special reason: the number one thing about CW
> is that the Morse code can be read mentally or written without any
> machine intervention,

Again, the EXACT same thing can be said for FSK using Baudot or
ASCII as long as you're willing to SLOWWW WAYYY DOWWWN to rates
that are comparable to OOK Morse transmission rates.

The entire argument of that Morse is "superior because it can
be copied in one's head" is a Potimkin (sp?) Village/Emperor's
Clothes construct ... a scam which attempts to conceal the facts
for the purpose of deterministically arriving at the
desired/predetermined/(pro-Morse) "conclusion."

FREE LIST: McMurdo Silver Material (c1930's)

*
If you are interested in McMurdo Silver, let me know!

I just picked up some nice old McMurdo Silver mail order ephemera, and I'll be sending out periodic announcements to those interested, when I put each lot up for sale.

Each lot comes complete in its original envelope, as sent to the prospective buyer (order form, price list, cover letter, etc.) back in the mid 30's.

I have six lots. They will not be auctioned. They will be sold on a first-come-first-serve basis.

By requesting to be on this McMurdo Silver list, you will receive only six email announcements regarding the McMurdo Silver material (one per lot), then you will receive no more, I will dump the list, and I won't bother you anymore (unless you request to be bothered).

Request to be on this list! If you're a McMurdo Silver buff, you won't want to miss it!

If that's what Newt's office told you, they're wrong. Doran is correct
that they plea bargained and settled with a $500 fine and no jail time.

For a single chip 2m FM transmitter, see the Motorola appnote for the MC2833 (follow it with a single transistor tripler to get to 2m, or two triplers to get to 70cm). For a single chip receiver, see the Motorola appnote for the MC13135 (2m). At one time, Motorola was giving away evaluation kits for these two chips, IE, you got chips, the appnote, and a circuit board. The passive parts needed are listed in the appnote complete with part numbers and sources. I don't know if they still have any of these evaluation kits, I got mine a couple of years ago, but the appnote is still available.

The single chip receiver can stand the addition of a preamp (there are many circuits for preamps in the Handbook, or in the Proceedings of the Central States VHF Conference, which would be suitable). And the transmitter chip only puts out 10 mW, so an amplifier following it will be helpful. One of the hybrids sold by RF Parts will do nicely. You also need an audio output amp for the receiver, the classic LM386 circuit will do, or Motorola has a chip specifically for this purpose which features a compatible squelch gate.

This can make a nice simple basic rig that isn't challenging to build. The availability of subsystem ICs and hybrid power modules has made building VHF+ rigs easy. (Build it in modular sections.) It won't compete with commercial equipment in bells and whistles,

but it will serve to get you on the air. Crystal it for your favorite repeater or simplex frequency. It shouldn't cost over $50, and the bulk of that is in the crystal(s) and the hybrid amp.

(But note that you can get a commercial surplus Motorola or GE FM rig for $50 and convert it to the amateur bands for the cost of a pair of crystals. This gets you tight helical filters in the front end for superior pager crud rejection, and an excellent power amplifier to a really decent power level, IE 80 to 110 watts. This is the best way to go if you just want a good rig for the least expense.)

For a bit more challenge and flexibility, the Rick Campbell R2 and T2 designs (in the Handbook, kits available from Kanga) allow you to work SSB/CW on any band from 160m to 70cm depending on the LO you choose (You might want to use one of the DDS circuits recently published in 73 and QST, or a simple crystal oscillator will do). Again for more power, the T2 needs a power amp, and again RF Parts has suitable hybrid bricks to handle that for 2m or 70 cm. For HF, you'll likely want to build a discrete amplifier using either bipolar or FET power transistors. Chris Boswick's book, _RF Circuit Design_, can help you there. Or you might consider one of the amplifiers featured in Motorola appnotes for output power up to the 140 watt level.

Building respectable HF equipment is more difficult than building VHF+ equipment because you generally need much better selectivity and the ability to handle strong adjacent channel signals, and you generally need more output power to be effective, but it isn't all that hard. Again, build in modular sections so that you can easily isolate and troubleshoot any construction or design problems. This one may cost you a bit over $200 to build unless you shop very carefully.

If you want really hot performance, modify the R2 to use a DSP back end. I use the Analog Devices evaluation board for this. This simplifies the R2 because you can dump the opamps used for gain and audio phasing, and do that in software. It also allows you to demodulate arbitrary modulations, including FM, FSK, or PSK as well as SSB and CW. You can also modify the T2 the same way so you can generate arbitrary modulations too. This begins to approach the performance of top of the line equipment like the new Kachina computer driven radio (not quite, but it is getting close). The DSP board is about $100 (though you can add DSP to your board for about $15 in parts cost, but you'll have to program and debug it with a separate fixture).

Hope you realize that using a 35 watt linear driven by a 5 watt AM
CB signal will result in about 8 watts output, about 1/3 of an S-unit
improvement. Linears are *very* inefficient for AM. The truckers using
their high-powered linears are primarily heating their trucks with it.

I'm hoping that one of you fellas could tell me a little about an item
in this manual that covers the installation of a 'cylinder' above or
around an antenna loading coil to add capacitance.
This seems incorrect to me but it's been given to me as a reference and
as a substitute to a capacity hat so I've got to look into whether it
works or not.
Anyone heard about this?

Tnx and (((73)))

As others have pointed out, this can be a major can of worms.
Have you considered DDS instead? Stability, frequency agility
and a lot less hassle to make it go.

Another cute idea is PA0KSB's Huff and Puff circuit, which
stabilizes a VFO against a crystal reference...

You do know that operating a linear amplifer in the 11 meter is against
the rules and regulations.
You need to read Part 95 of the FCC rules and regulations.

Hi,

I am homebrewing a HF linear with a pair of 572's. Basically, I am following the details as given in the 1977 ARRL handbook for a 160m amplifier (which uses the same tubes). However I haven't found any good reference on the output impedance of the tubes and tank circuits for the 10-80m bands yet. I wonder if someone who owns a SB-200 (with schematics) could give me some details on tank coils and caps. Any info would be greatly appreciated.

Thanks,

Not bad, I wouldn't think of building a power supply this big without including a VARIAC for adjustments. 5600 maxed out wouldn't be bad for 4000 volts nominal. Of course he would have saved some greenbacks by getting a smaller transformer.

Before the British Post was established in 1840, the recipients of mail had to pay the postman for the mail they received. Imagine if you had to pay to receive your Publisher's Clearing House Sweepstakes entry envelope. Duh, you pay NOW to receive unsolicited commercial email (UCE), also known as SPAM.

In 1840, the paradigm changed. The sender of mail bore the full cost of delivery, and the recipient got it free of charge.

It's 1997, and it's time to adjust the paradigm. If I am paying $20 a month for the privilege of receiving mail, I expect that the unsolicited mail senders will bear the full cost of my receiving mail. So that means -- I get lots of SPAM -- they need to pay me 10 cents per SPAM to cover MY cost to receive it.

Either that, or the SPAMmers will pay all costs associated with my email account, while I receive unlimited dial-up internet access through that account from anywhere in the U.S.

And why not? Advertisers pay for air time on TV and radio. Why should we PAY for advertisers to abuse us? Oh wait, I forgot, that's cable TV and DSS. Fortunately I don't pay for that.

ObHomeBrew content:
None. I spent it all on dealing with SPAM.

A little known secret most hams would be unwilling to share with cbers is simply to stick a pin in your coax and tie one side of a 220 volt ac line to it. Tie the other side to the outer shield. This should be good for more than 50 watts. (Don't try this when your clothes dryer is running or else you'll trip the breaker breaker).

# 3632. Re: Morse in the 21st century

AA1FA davidc@bit-net.com replied to Gary KE4ZV,
> Why would you do that to the Extras who value their own "sanctuary"?
> Seems they earned it by completing the toughest possible testing.

Did Gary suggest taking it away from the Extra's? I don't think
you can read that into his suggestion without malice or assumption
of malice. It would suffice to amend Part 97 to prohibit non-OOK CW
from the Extra class data-sub-bands. He does suggest prohibiting
you from contacting Europeans via RTTY or Clover in your sanctuary,
but I doubt Europeans expect to find technosavvy Americans in the
Extra subband ... as if round green keys were technosavvy by
any standard except within amateur radio *sigh*

Until the number of license grades is decreased from the absurd to
rational, having the portion of each data sub-band which is reserved for Extra
Only operators, be marked for CW-only would make sense.
(And if we ever acheive the two-class structure of most of the rest of
the IARU member countries, the low ends would still be a fine place for
it; starting it as Extra country makes it the HiSpeed end by default.)

Forcing Extra class RTTY/Pactor/Clover ops to use the AA data
segment to talk to each other doesn't seem a horrible price to pay
for their die-hard straight brethren to have sanctuary from the
rabble.

Requiring the 20wpm hazing of folks who want to operate in the CW
Sanctuary seems reasonable.
(I fully expect the reactionary ARRL to shoot the hobby in the foot
again by instead proposing the Novice subbands have RTTY/data barred
from them for all classes, including 10m where even Novices get
RTTY/Data today. This would be justified only if the non-QRO
requirement for all classes were re-instated, at a lower QRP level,
making the Novice Bands the QRP Sanctuary. Although I still think if
Novice/Tech+ is to do any good at drawing people into modern HF
operating, they need some RTTy/*tor privileges besides 10m & VHF+.)

(Far more reasonable than the only actually part-97 mandated CW-only
subbands -- 50.0-50.1 and 144.0-144.1 are CW ONLY, including
beacons, no sensible codings or modulations permitted, with the initial
intent of barring no-coders from them, but the FCC sensibly dropped
that -- being available to scummy no-coders like me with no obvious
qualifications aside from memorizing a few measly answers and a desire
to keep this technical hobby alive.)

Message-ID: <3443733b.4735523@news.prestel.co.uk>
Source record: 90009

Hello

Just an open question on PLL analysis software. Most PLL analysis programs I have seen so far depend on the phase detector having a voltage output that is related to the phase change. So the loop filter takes the form of a transfer function of Vo/Vi.

But some ICs that can be bought that are PLLs( Phase Detector+divider etc) have current output from phase detector and hence use different loop filter structure which has the form of Vo/Ii so the PLL analysis cannot help.

Any ideas (I have one or two myself, but await interest)

Pat@Orrell.prestel.co.uk

The built-in cap for UHF use is usually 1000 pF, while 2700 pF is common for VHF use. The latter is enough for frequencies down to 30 MHz. Either your measurement is wrong or there is some other cap connected to the sockets.

Source record: 89916

For a single chip 2m FM transmitter, see the Motorola appnote for the MC2833 (follow it with a single transistor tripler to get to 2m, or two triplers to get to 70cm).

A similar chip, the MC2831A, was written up by W1FB in _QST_, March 1990 (pp. 31-33). Alas, it was designed for 10 meter (not even 6 meters). And yeah, and it already had to double the 14.5 MHz VXO to get 29 MHz (with 28 KHz adjustment). It suggests using an 18 MHz crystal and doubling the results of their design twice to go from the 36 MHz to 144 MHz. But that would only have 120 KHz of adjustment, e.g. not enough to even cover the whole satellite sub-band. And then there's spectral purity issues...

You're right Gary, a tripler to get to 48 MHZ and another tripler to get to 144 MHz, and you're in business. Maybe put in a Toko helical filter and not even think about emissions (or pagers on the receive side). But for FM, you're stlll rock-bound to a tiny segment of the 2 meter band.

For UHF, how about the MC13176 (FM, AM, and presumably CW)? Its reference crystal would be about 13-14 MHz (internal pre-scaler), and i bet you could use an older DDS (AD7008) as a reference (talk about fast frequency switching!). If you could make a MHW703 ($37) run at 440 MHz (spec'ed for 450-460 MHz), i bet you could run the MC13176 thru a Toko helical, through the module, and get 2W out with decent spectral quality. (And Motorola probably makes something better spec'ed for 430-450 MHz).

I'm *still* looking for a decent homebrew project for 6 meters or above that has useful results for under three figures. (Ramsey doesn't count, i want reasonable sensitivity or good spectral purity. R2/T2 still need sophisticated VFO at VHF or above, and either pre-amp or PA.) And let's not compare apple with oranges, people are working HF QRP under three figures, and that's a fairer comparison. That is, can one at least work someone across town under poor conditions?

The theoritical projects are fine for experienced people with decent test equipment; i'm interested in something more along the lines of reproducible project. And heck, i'd even settle for CW-only if it were something a Technician could use. Even if they can't decode it by ear, with a decent amount of hacking, their computer probably could. If one can hand-send and only responds to CQs from stations that one's software is currently able to decode, rather than issuing CQs, the other end may not even know it's not being received by ear... And the technician has gotten out of the FM rut.

How about something real to build that isn't HF?

>op-amp. Problem is...all the "build it cheap and quick" articles
>_are_ for the 40m CW crowd!

However they don't have to be. A number of projects come to mind:-

1. Crystal-controlled 6m or 2m FM transmitter (can be as low as 20mW if in a good spot relative to the repeater)

2. 6m or 2m receiver using an AM car radio as a tunable IF and a simple homebrew converter. Note that by using a 600 kHz IF, only one crystal is required for the transceiver if it is teamed up with (1) above.

3. DSB gear for 6m or 2m (see Solid State Design)

4. AM gear for 6m (see some JA hams' web pages for info - links below)

Clubs/groups wanting to encourage this type of activity could assist by providing a 6m AM input to their two metre repeater. Then one need only build a simple 6m AM transmitter and use a cheap scanner (covering 2m) to get on air.

Source record: 89922

PLL design is really not a great thing to tackle if this is your first receiver project. You can get some bssic information on their theory and operation from the ARRL handbook. If that doesn't convince you to run screaming in the other direction, the next reference to look at would be the PLL synthesis books by Ulrich Rohde and Roland Best.

From reading the 1993 Edition of the ARRL Handbook, it seems that one of the things that make this really hard to do is to get a reasonable settling time on the synthesizer. Most radios use the same PLL for both transmit and receive, and trying to make that shift happen fast enough requires a really good PLL design.

Now, suppose we're using a PLL for an R2/T2 pair (or a different PLL for transmit and receive) at 6 meters and above. And suppose we don't try to scan on a per-channel basis, like an FM rig does, or shift for repeater usage. Could we then slow down the loop substantially and make smaller corrections, thus making it much less critical to design and at the same time, have much less phase noise?

Yes, but not many more. 170-Hz RTTY can be done with only a 250 Hz
bandwidth, about the same as most of us use for CW. It's true that CW
can be done with even narrower filters than that, but it's difficult
to tune and hard to listen to for any length of time.

FREE LIST: McMurdo Silver Material (c1930's)

*
If you are interested in McMurdo Silver, let me know!

I just picked up some nice old McMurdo Silver mail order ephemera, and I'll be sending out periodic announcements to those interested, when I put each lot up for sale.

Each lot comes complete in its original envelope, as sent to the prospective buyer (order form, price list, cover letter, etc.) back in the mid 30's.

I have six lots. They will not be auctioned. They will be sold on a first-come-first-serve basis.

By requesting to be on this McMurdo Silver list, you will receive only six email announcements regarding the McMurdo Silver material (one per lot), then you will receive no more, I will dump the list, and I won't bother you anymore (unless you request to be bothered).

Generally, these lots cover the Masterpiece II, Masterpiece IV, Masterpiece V, and the World Wide Nine. Some lots include copies of "The Silver Times."

Request to be on this list! If you're a McMurdo Silver buff, you won't want to miss it!

OK. That sounds familiar. I would occasionally have the same
problem with my and other sites, but thought it was a NetScape quirk.
Trying out the new Explorer 4.0 but haven't noticed the problem yet.
If I do then I'll suspect my ISP as the culprit. Usually reloading
will correct the problem.

Message-ID: <199710151710.NAA10558@pop.uky.edu>
Source record: 89928

Larry,

First try a simple kit. Edlie electronics has a kit made by
Elenco Electronics AM/FM for $23.95 (AM only for $19.95). This is a
AM/FM radio kit on a large circuit board with the schematic
digram silk-screened on the board. It is easy to assemble and
is great for your first project because it is spread out over
such a large area. Also it comes with a 51 page instruction
and assembly manual that guides you thru a number of experiments
and even has questions to be answered after each chapter.

This type of kit will help you understand most of the
major elements of a radio:

AF Amplifiers
IF Amplifiers
IF Limiters
Detectors AM and FM
Mixers and oscillators

This kit and a little help from the ARRL handbook will
improve both your knowledge of radio and assembly skills.

Then you can move on to other projects. You could even
use elements of this one to build something else.
This is the first kit of its kind I have seen in years.
It looks good to me even though it is not on a ham band.

Hi Rick,

There's a fellow that lives a few blocks from me who produces
the "Skywalker" brand of solid state HF amps. He produces them
in either kit form, or already built. They're made in power
levels of 300-600-1200-1500 watts. If you need his phone number,
write me back and I'll look it up for you. It's in practically
every 73, CQ, QST magazine. Look for the classified advertisement
with an address in Myrtle Beach, SC on Chickasaw Lane.

Remove all the ! from my e-mail address to reply!!!

I beg to differ. The reason you are only getting 40 watts is because
you overlooked the fact that you are working with a 220 volt line,
and not 110.

You have to ground the chassis of the CB to the neutral of the 220
volt line, otherwise it will be unbalanced and you won't get the full
power boost. I get almost 56 watts. Maybe m-m-m-m-more.

Don't you know anything about electricity??

Of course. The cell phone is probably the most common element people can identify with. By claiming that this bill helps protect people from listening to your cell phone, you get a lot of otherwise ignorant-of-the-facts public on your side because, OBVIOUSLY, nobody buy a "peeping tom" would want to listen to someone's phone calls -- and (their rationale) "I KNOW *I* wouldn't want anyone listening to MY phone calls."

This is a tactic well known and used by many groups, especially groups like gun control advocates, who routinely parade "assault weapons" in front of the public as "cop killers" even though those classifications of guns are only responsible for 2.5% of the crime in the US during any given year. Same result from the public: "Well, I know *I* certainly wouldn't need one of those guns, so why does *HE* need one?"

Hmm, I don't think I've seen 'linear' used in that particular context before. :-)

DDS's only real drawback for HF use is its relative lack of signal purity due to quantization and phase-accumulator truncation. Even so, the output of an AD9850 is probably cleaner than a lot of homebrew VFOs and synthesizers constructed without adequate knowledge and/or test equipment.

At any rate, you'll have a VERY hard time convincing me, or anyone else, that PLL's are "easier" to deal with from a homebrewer's perspective. DDS is about as idiot-proof as you can get.

> It is much
> harder to get rid of spurious responses with a DDS chip than with
> a PLL.

It's best not to look at DDS and PLL as competing synthesis technologies, but as complementary ones. One very effective solution is to use the DDS as a reference and "clean it up" with a simple, narrow-bandwidth PLL. This allows a fixed division modulus and a very elementary single-loop design, far simpler than the usual multi-loop, variable-modulus monstrosities used in most commercial gear.

For someone who's just playing around, though, and wants a simple, flexible solution for SSB/CW reception across multiple bands, I don't see anything wrong with using a DDS directly into the first mixer. Sure, strong signals may tend to cause spurious responses due to phase-truncation spurs, but it'll still be a much nicer overall compromise than a lot of multi-band homebrew designs. (Plus, a lot of the nasty out-of-band stuff can be eliminated with a preselector in front of the mixer.)

The original poster isn't trying to put Rohde & Schwarz out of business -- he's just trying to build a basic synthesizer and play around with it as a receiver LO. Once he gets the basics down, he'll be in a good position to experiment with hybrid techniques to clean up the spurs.

> Motorola had some pretty good application notes on PLLs

Peter, I hava a AOR900 Handheld scanner and I can hear BOTH sides of the conversation most of the time. It seems the closer the cell unit is to either the tower or my house it is possible. Don't quite understamd it. I find more and more channels with digital signals are becoming more common. It probably won't be long before they are all digital. My personal phone is in the digital mode and quite often it acts up and the conversation becomes unreadable. Hope this answers your question. Also listening to cell conversations is mostly innocent. How do I know who I am listening too??? Before the conversation gets too involved the link is passed to another tower and another frequency and I no longer can hear it. By the time I could possibly find it again it is over.

I have a two channel Motorola Maxar 80 UHF transceiver. I need to locate a schematic as I would like to move it down into the 440 range. I don't want to purchase a service manual as that would be more than the radio's worth. I would be happy to reimburse any reproduction costs.

Thanks,
Jim, WA1GPO

What's amazing to me, is how one guy targets the cell phone end of the debate and that is what has fueled this round for some time. If you get an overview of the proposal, it is NOT just cell phones, but Police, Fire, Businesses, etc. which will become illegal to monitor.

If you own a mobile, HT or scanner that is capable of receiving these things, it will be illegal....and there is NO grandfathering on this one, if passed as written. The fact is, this could greatly harm the hobby, as many of us work with Police and Fire. Some groups work hand in hand with them.....take the group in Flint, MI for example. So your attacks on those "listening in" or "being nosey" are little more than a cheap shot at some hard working hams.

Wise up gang, we can lose a helluva lot here and I, for one, will not stand by while the parade passes. Write your representatives in Washington and tell them to forget this idea and protect Amateur Radio.

Even worse, there are still people paying hourly charges (or who don't have toll-free local access numbers) for their 'Net access. For these folks, there's a direct & defined cost of spam, just as if the recipient was paying the postage for USPS spam.

Actually, you *do* still pay something for the spam you receive in the US mail. Either you throw it out, or you recycle it -- either way, someone has to be paid to dispose of it, and chances are your tax money pays that person.

Webster D. Williams wrote:

> I'm looking for the code needed to send to an EPROM that
> would allow it to be a beacon keyer. Anybody ever do this?

The EPROM doesn't actually do the sending; it just holds the
message you want to send.

There are several ways of doing this. One is to burn a bit
pattern into the EPROM that corresponds to what you want to
send, like this for VE7LDH:

10101011100010001110111010101000101110101000111010100010101 01

(i.e. dididididah dit dahdahdididit didahdidit dahdidit dididididit)

You then cycle through the EPROM locations with a counter and
apply the output (0 or 1) to a keying circuit. Since the EPROM
output is often 8 bits wide, one cute setup stores 8 different
messages, one per bit, which you select with a switch.

Another way is to use a computer. Save the message in whatever form
is suitable (e.g. 1 = dit, 2 = dah, 3 = intercharacter space, etc.)
and then have a microcontroller read the codes in succession,
decide what they mean, and apply the results to a keying circuit.
This is much more flexible, since it allows you to easily tweak
things like weighting and spacing, which are fixed in the first
approach.

> Pat@Orrell.prestel.co.uk

It really doesn't matter what the phase detector puts out - you end up
converting it to a current anyway.

For example, the "Charge-Pump" outputs on some devices are actual logic
levels - TTL for ttl parts, ECL for ecl parts.

The signals go through a series resistor before they get to the filter.

Apply good old Ohm's Law, and you get the resulting current.

The old Motorola RF Data Manual (1978 version) has a reprint of an application note that describes what you are looking for.
It is AN-762, Linear Amplifiers for Mobile Operation. An adaptation of this application note was published in QST under the title, "Build this Solid State Titan" and was published in the ARRL Handbook in (I believe) 1981 or 1982. Communication Concepts sells a circuit board and some parts kits for a version of this amplifier.

As you are probably aware, use of amplifiers is not legal for CB.
You are responsible for the legal operation of your station.
You are also responsible for NOT asking commercial ventures such as Communication Concepts to assist you in illegal operation of your station.

I have seen a number of vendors on the Internet who claim to sell amplifiers that will work on the CB band with 5-watt CB radios, but I have not verified their claims. In spite of any possible usefulness of these amplifiers, the fact still remains that their use on CB is illegal, and their sale for use on CB is illegal as well.

FWIW, an 811A in GG with 1500V on the plate will give 200 watts all day long with 10 watts drive. One jug and one junk microwave oven will get you there if you know where to connect the five wires.

I think that we need a discussion what place Morse Code will
play in the next century. While some will remark that the
military, including the Coast Guard, have deserted Morse,
others will comment that the Navy Academy is still teaching
it. There is a move to bring it back into MARS but that is
due to some of the older members wish to continue using it.

We need to have people like Jeff Herman, who was there when
the Coast Guard stopped the use of code, to give their insights
of what the military and merchant marine communities are heading
towards. We need the insights of others.

I am Army, still serving. We do not use the code, even morse
intercept is gone. Digital is king. Even the Navy is highly
dependant on digital with the Tactical Digital networks at the
fleet level (I completed four years of Navy ROTC at Purdue just
for fun and relief from my engineering courses). Most of business
is going digital. But someone should keep the skills alive, if
for no other reason than just fun and the romance of the old days.

I believe that we see the Morse requirement be lowered to 10-12
wpm. The 21 wpm will most likely disappear. But some familiarity
is needed, just not a high skill level. This is in line with the
rest of the western world. (Along with tougher but few testing
elements.)

>for FM, you're stlll rock-bound to a tiny segment of the 2 meter band.

The MC2833 is designed for the 49 MHz cordless phone and baby monitor
market. So you only need a single tripler to get up to 2m. Another tripler
can then put you on 70cm. I wouldn't try to VXO this. Since the chip is FM,
I'd just crystal it for a desired channel and call it a day. In fact that's what
I did. If you want more channels, add more crystals and a rotary switch
just like the old days. (Note, you can use this chip directly on 6m.)

The PA hybrid I used is the MHW607-2. This gives 7 watts out for 1 mW
in on 2m. I use a Toko helical filter on the output, doubles as the receive
front end filter for the MC13135 receiver chip too (that chip works directly
up to 200 MHz). This combo makes a fine basic FM rig. It'll serve nicely
for packet (1200 and 9600 baud), for example.

>I'm *still* looking for a decent homebrew project for 6 meters or above

>someone across town under poor conditions?

Well, I'm using a simple crystal oscillator with my R2/T2. If you want
frequency agility, then you might want to look at the Fujitsu MB1501
frequency synthesizer chip. It is good up to 1.1 GHz. It has everything
but the target VCO included on the chip. I've used it in a couple of
designs and it is easy to work with. On VHF+, you don't have to
readjust the RF phasing network unless you make a *large* frequency

change. On HF you do, so you might prefer a DDS with a quadrature output built in for that.

I haven't looked for any hybrid power modules for 6m, so I can't advise about that, but there are suitable linear power modules for 2m and 70cm available to take you up to at least 30 watts. That'll do more than work across town. These need more drive than the T2 can supply, so you'll want to use a CATV trunk amplifier hybrid between the output of the T2 and a high power PA. All this stuff is basically plug and play. Operating the CATV hybrid at 50 ohms instead of 75 ohms doesn't seem to bother it. There's still plenty of gain available to drive the high power PA.

>
>How about something real to build that isn't HF?

I suggest you go ahead and build a R2 and T2. Get the Kanga kits if you don't feel up to scratch building them. This gives you the heart of a SSB/CW rig with proven performance. You can use a simple crystal oscillator with this in the beginning. Later you can build a PLL or DDS for it. (I'd suggest a DDS with a very simple clean up PLL.)

You can even use a VFO with it if you operate it on HF and use a transverter up to VHF+. Most transverters want to see the drive level the T2 provides. The Suffolk transverter (in the RSGB VHF DX Book) would be a good one for this, or a quick and dirty approach would be to use the Hamtronics XV2 kit. If you set the T2/R2 up for 20m, you can use the Ten-Tec transverter kit to 6m. (Of course remember that the T2/R2 *will* work directly up to 500 MHz with the proper LO. It's your choice.)

You can use the T2/R2 as a fixed IF with a crystal LO and make the transverter LO tunable. There can be some advantages to this approach, though it is more complex than using them directly on frequency. For example, you can have a number of switched transverter decks for multiband capability. Since the transverters will normally be using a LO with a high multiple, you can use a crystal VXO for this. That's simple, cheap, and nearly foolproof. (Remember that most of the cheap QRP HF rigs are crystal controlled too, and they won't have nearly the pulling range you can get with a high multiple for VHF or UHF.)

The key thing is to keep everything modular so you can concentrate on one thing at a time while initially getting it going, and then improve one thing at a time later. This should keep you out of major trouble.

Having accesss to a spectrum analyzer is nice (and downright essential
if you use one of the crappy Hamtronics modules), but you can get away
with just a tunable receiver as your test equipment if you stick to the plug
and play hybrids.

->
-> Jim

The integral coaxial screen bypass capacitor is a feature that was demanded by VHF/UHF frequency operation where the length of the path to ground was kept as short as possible in the interest of stability. If you are planning on using the socket assembly at HF, just hang some additional capacity on the sockets' screen terminals and don't worry about it.

This coming Sunday..

*** !!!! WE ARE BACK IN THE GARAGE !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
October 19th, 1997
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Seperate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Cecil replied:
> What percentage of CBers use SSB? Just going by the odds.

I wouldn't know, haven't listened to chicken band since '76.

Since multi-service radio mags CB columns and radio reviews
discuss things like the advantages of SSB and people talk about
it being crowded, I assume they take advantage of it.
Although I'd be sure other folks use AM so they can QRM two SSB
conversations at once. If they try to use their linear with AM,
hey, why should we complain? Might make them harder to finger to
the FCC field office, but ...

HI Andrew OM,

Over a dozen years ago now, TAPR, Tucson Amateur Packet Radio Assn,
kitted a very good
design with excellent documetation available, for building an AX.25
packet protocol
Terminal Node Controller. I built both a TNC-1 and a TNC-2, the latter
of
which I still use. Keep in mind that today, multimode controllers are
sometimes
erroneously called "TNC's" even by their manufacturers in
advertisements. "TNC"
applies only to AX.25 protocol, not Pactor, Amtor, RTTY, CW, etc. As
such,
the TAPR TNC-1 and TNC-2 were strictly AX.25 packet TNC's. See the ARRL
Web
Page for links to TAPR.

73,
Don, W6JL

An indirect reply...
Lately it has been a practice for large transmitters (5-10kW TV, FM
broadcast etc) HT fuses are avoided for transmitters, but include a 50
ohm 50W resistor between power supply and power supply. Use only mains
fuse. The extra series resistor is always a good practice.

"Terminal Node Controller" leaves me cold, too.

You have a Modulator/Demodulator (MODEM) on your PC or you wouldn't be here. Imagine that instead of the serial data stream going back and forth between the MODEM and your PC, that instead it's going back and forth with a similar box that listens to the audio from your ham receiver and sends commands and data to the ham transmitter. The TNC is usually designed to do many different "modes" (RTTY, CW, Packet, etc) whereas the MODEM only has to do one (convert serial bit stream to tones and vice versa).

>for no other reason than just fun and the romance of the old days.

Fine, keep it alive; many will do so. However, the "doing so" need
not be forced on others by government, as there is no justification
for government to continue to do so, IMO.

>
>I believe that we see the Morse requirement be lowered to 10-12

Why, if at all, is familiarity, "needed"? Awareness of its
existence, yes; curiosity, yes; capability, yes; ability and skill,
yes. But by choice, not by force, IMO.

You might try contacting TAPR (Tucson Amateur Packet Radio, http://www.tapr.org).
They were the designers of the original TNC-2 that most of the basic TNC's these
days are clones of, and they sell plans and kits.

Tab Books had a book entitled (I think) "How to Build Your Own Earthquake, Solar, and Weather Sensors" (or something of that ilk; I'll have to check my bookshelf when I get home). This book covered all the electromechanical issues of constructing the sensors; however, it does not have any computer stuff in it on how to encode the sensor outputs into digital form.

For the digital side, I recommend looking in old issues of BYTE magazine (10+ years back, when it was for hobbyists instead of academic scientists & corporate engineers) for the various columns by Steve Ciarcia, or Steve's books "Ciarcia's Circuit Cellar"; Steve covered a lot of different computer-to-arbitrary-thing interfacing techniques, and gave actual schematics with part numbers. You may want to update his circuits to use modern chips, but the theory is sound. There were other articles in the old issues (I remember one cover article on computerizing a large model train layout, with the software to simulate a real railroad switch control center, and the sensor interfaces to provide closed-loop feedback of train locations on the tracks) that also covered non-standard interfacing issues.

If all you want is a weather station (as opposed to the educational opportunity of designing and building it), you can get commercial computer-compatible systems for less than it would cost for you to design and build one from scratch. In my shack, I have the Peet Bros. Ultimeter 500 weather station with the optional electronic rain gauge and PC data logger interface. It works very nicely, and has a battery backup system for the control unit's weather history memory (one 9V transistor radio battery, not a $500 UPS). Now, if I can just figure out how to tie this to my ISDN router, so I can have remote "time & temp" from my shack.... :-)

Hope this helps.

Hello everybody,
I recently purchase an Alinco DR-112. I noticed that it receives/transmits a
little bit out of the frequency on the LCD. Which is the part (variable
condenser) that I must tune?
Which is the part that must also tuned/replace, in order to get more power
than the 25 Watts?
Thanks in advance to all. I'm asking these questions, for I have no manual.
Bye........

>environmental advantage, too

If you are still using a fixed speed mechanical teleprinter and fixed
demodulator filters, slow CW may have some advantages for low
signal (IE low power) operation. But with many amateurs using software
demodulation and printing, that advantage can be made to disappear
simply by lowering the data rate and shift of the "RTTY" station and
adjusting the filtering to match.

Software systems like Coherent can lower the signaling rate to as low
as 1 baud, and match filter it. At that point, occupied bandwidth drops
to about 2.33 Hz, much narrower than an OOK Morse modulation,
and required signal levels drop to many times less than needed for
manual CW too.

But because of the decoding advantages of a uniform code and use of a fully
voiced modulation, you don't need to go that slow to beat manual OOK Morse.
Because you *can* match filter the modulation, and because you *can* get a
decoding gain, the required CNR for 100% copy is lower than for systems,
such as OOK Morse, where you can't do that. So you can trade CNR for
speed and increase speed while still keeping CNR at or below the manual
detection threshold.

>By the way, is still the mainline TT/L tube type TU (QST 1964?)
>expected to be the best?

No. It was a very good system for its time, but use of DSP techniques has allowed us to handily surpass it today.

I am not even sure if this is a relevant response to your post...

In a fit of enthusiasm, I bid on a couple of ham radio items at
an estate
auction. I had and have no earthly use for either of them.
They are:
1) A Heathkit Electronic Keyer. (This has two paddles, a
speed and volume
knob, and a line power lead for 120/240 50/60 or optional
12VDC)

2) A Computer Patch Interface from Advanced Electronic
Applications Inc
Model cp-1
Six front panel buttons, a var shift knob, a 'tune' led display.
With three connectors.
Requires 16 volt AC (not provided)

I have no idea if these items are functional.
Sell for $10 each as is, or $20 each, with money back
guarantee.

# 3724. Trade 75A1/270G1 for HF amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-17 00:00:00 UTC
From: "Lane C. Zeitler" <km3g@cts.com>
Message-ID: <01bcdc12$0409bb80$66a0d8cc@km3g.cts.com>
Source record: 89816
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap

Material condx is ~ an 8 on a 10 scale. The 75A1 needs to be cleaned up, painted, maybe re-tubed and aligned. Both units are very restoreable to a 10++. I have the original manual which is in pristine condx. The tuning dials are excellent and not tinted yellow.

Recent acquisition of a 75S2 in need of work has demanded all of my "free" time hence the unloading of this "project".

I prefer not to sell but to trade for an HF amp. I am very flexible, just no sweep tube amps please. An amp with or w/o tubes??????? What do you have???

# 3725. Auction - Fair Lawn Amateur Radio Club Annual Auction, Nov. 14th - 8 PM

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-17 00:00:00 UTC
From: jas130@juno.com
Message-ID: <628on2$2gs@news.genrad.com>
Source record: 89817

On the evening of November 14th, The Fair Lawn Amateur Radio Club
will host it's Annual Auction.

It will be held at the Fair Lawn Cultural Center,
located at 12-56 River Road, Fair Lawn, NJ 07412,

Ham Radio, CBs, Computers, Electronics, etc.

Those interested in auctioning their merchandise should arrive at 6 PM.
The auction will begin at at 8 PM. For info call Joe, 201-778-3211.
You may Email with any questions at jas130 @ juno.com.

Directions: (or call for more detail)

Route 208 To Fair Lawn Avenue (west)
Fair Lawn Avenue to River Road, left turn
About 2-3 blocks, FLARC will be on right side

Voltage will still be 6000 volts, with the increased frequency you probably ought to be able to pull an extra 10-15 percent current for the same heating.

Try a visit to Jim's Duplexer Page for details:
www.dallas.net/~jvpoll/dup6m/dup6m.html

It is not too difficult to build cavities if you can get a source of
materials. I built 2 metre cavities using 4 inch aluminium tube which
had been used as protection for under-sea anodes. If you have any
friends in the oil industry, this would be a place to resource the tube.
I managed to get 83 db of isolation using six cavities, allowing single
ant. working.
Tuning is also simple. All you require is a RX and TX for the
frequencies you will be using, an attenuator to protect the TX during
tuning and lots of patience.
Good luck with the project.

Message-ID: <344774E1.4B7C282@global.internet>
Source record: 89821

Is there a news group dedicated to analogue/RF design ?

Has anyone come across any practical/reference material
for designing RF amplifiers or analogue design in general.

My background is primarily digital and would like to learn
more about the analogue/RF side.

Do people actually use the different y,z, scattering parameters
for designing analogue amplifiers, oscillators, modulators etc ?

Anyone know of any freeware smith charts for speedy calculations ?

Anyone know of any good books for analogue/RF design - which are
more practical based rather than theory ?

Appreciate your help.

atul.

> you
> absolutely certain about that measurement?

It may well be that much. I have more then that on the 4m PA, made up
from the
small low inductance screen capacitor built into the base, plus some
small 100nf bypass capacitors with the aim of HF parasitic suppression,
plus a 4.7uF across
the supply to improve dynamic regulation at AF. It depends where you
make the measurement. A typical fabricated capacitor could be many times
the area of the
EIMAC standard base capacitor. 120nF sounds too high but there may be
some tubular ceramics lurking inside the assembly.

What is most important it the amount of inductance. What is the self
resonant
frequency of this screen capacitor?

As a practical matter, no, a single 811A will not give 200 watts
output on AM in GG. GG and AM aren't really compatible, especially
to get decent gain, and the plate dissipation on an 811A is
really too low to see decent output.

I supposed I should have said "200 watts all day long in CW
service." The CW duty cycle is much lower than AM. And while
I could ragchew a single 811A at 200W PEP, I don't think it'd
last for very many hours of contesting or net controlling.

A pair of 811As in push-pull, plate-modulated, was a common
configuration for a 100-watt AM rig back in the dark ages.
Of course, this was before the days of ham radio monologues --
I won't name names but 3893, 3945, and 14313 come to mind.

Now, a pair of push-pull, plate-modulated 811As driving a 4-1000
in GG would make a nice kilowatt broadcast station. And if I recall,
wouldn't that 811A setup match nicely on an untuned input
of four 4-1000s in parallel GG?

THAT would sure be purty in an open rack, or better, a desktop rig
that covered the top of two desks.

Actually John is half right, it depends upon the cell site, but not on the distance to the site. What matters is the "sidetone" or the ability of the site's electronics to null out the other side of the conversation on a two-wire circuit. It can also depend upon the quality of the phone being used by the landline caller. There are usually a couple of places where a two-wire hybrid-nulled line is switched to a four-wire transmit-receive line in a conversation. Cell sites are FM, and so the audio remains constant no matter what the signal strength is. And by the way, you're right...there really isn't anything to listen to. I heard them once when I was repairing a spectrum analyzer, and found it totally boring.

Source record: 89900

Howdy,

I am designing a 20m Single conversion superhet. receiver. I have been going through a lot of single conversions schemes, and everyone I read or look at says nothing about the fact that the carrier of the received signal is surpressed, thus the L.O. and B.F.O. have no way to stay in phase with the Side band of the transmitting signal. Examining the flow of the signal from the antenna to the speaker in a single conversion receiver mathematically, we find that at the speaker, we do not get a perfect reproduction of the modulating signal, rather a distortion that is a function of this phase error. I know that these single coversion receivers work great for SSB, but why is it that we still get the message signal at the speaker, when the L.O. and B.F.O. are not in phase with each other nor the transmitting signal? Is this distortion very minute at audio frequencies, thus making little difference in the intelligibility of the message signal? Or is it the fact that the carrier frequency is much much higher than the modulation frequencies, thus a phase error of great magnitude, causes little distortion to the message signal? I am stumped. If anyone can explain to me mathematically why this occurs, I would greatly appreciate it. Thanks.

On the contrary, if the capacitance really is as high as 120nF (0.12uF)
for two sockets, they are already designed for HF.

Eimac VHF bases are typically about 1nF (1000pF), and the HF bases about
3nF. Even for a two-holer, 120nF sounds extraordinarily high... are you
absolutely certain about that measurement?

One of the neat things about SSB is that the receiver does not need to be phaselocked with the incoming signal. In fact the two can have a small frequency offset (0 to 50 Hz). For speech this is acceptable. For music it is not very good, which is why SSB, without phaselock, is primarily a "speech" mode.

There are some systems that transmit a small pilot carrier that the receiver can phaselock to, which then makes SSB a good mode for music. A few shortwave broadcast stations and also some mobile speech-comm systems use this pilot carrier concept.

Another mode is double-sideband-suppressed-carrier (DSBSC). This definitely requires phaselock to the missing (suppressed) carrier. A circuit called the "Costas loop" looks at the sidebands and reconstructs the missing carrier and phaselocks the signal to it. This mode requires not only phaselock, but close to zero phase difference. An integrating (Type II) PLL is needed for this.

There are a large number of books that give a mathematical treatment of SSB and DSBSC.

You didn't say what band but I'm guessing 10m. If so the radio is fine.
The tubes that are available today will not do what the older ones
would. Occasionally you get a set that will do 100w on 10m but more
likely 80-90.

Kevin,
The exact phase of the signal that you hear is not
important nor is the exact waveform. Your ears are only
sensitive to the frequency and amplitude components of the
sounds they receive.
The only time there is a real problem
with a the BFO being in the correct phase is when you
are detecting DSB. There it is necessary that both
side bands are in phase when demodulated. Other wise
they may subtract from each other and reduce the
signal level. If the BFO is slightly off frequency
they will beat against each other making it difficult
to understand.

## 3743. Looking for info on B-1203 by Motorola

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-17 00:00:00 UTC
From: Frank Bures <fbures@address.in.the.sig>
Message-ID: <zrlmgywasnozt.pminews@frank.chem.utoronto.ca>
Source record: 89908
Cross-posted to: sci.electronics.components,rec.radio.amateur.homebrew

Subject says it almost all.

I need to replace two TO-3 transistors Motorola B-1203. Search in NTE database suggests NTE2525 in incompatible (therefore highly suspicious) package. Search on http://www.tds-net.com/ suggests two different types of transistors - again highly dubious.

Would please anyone with a Motorola catalogue old enough to contain this transistor, let me know what it is? PNP-NPN, Si-Ge and pin-out (B-E) would suffice.

Thanks in advance.

: >220 in,what would i get on 60hz.

: Voltage will still be 6000 volts, with the increased frequency you probably
: ought to be able to pull an extra 10-15 percent current for the same heating.

?? The nominal input voltage in the US would be 240, not 220, so expect
about 9% greater voltage. Current will be limited by heating as W4ZCB
says, but heating is typically half core loss and half copper loss; copper
loss will be nominally the same for the same current, and core loss
will be quite similar at the increased voltage: a bit more power
because of the higher voltage, but my recommendation is to not expect to
draw more current. Be careful about the current rating: is that a
rating for center-tapped full-wave service, or bridge rectifier service,
or RMS current in the full winding, or...??? It does matter: a choke
input filter draws far lower RMS current than a capacitor input filter,
for the same DC output current. Heating in the windings is RMS current
squared times resistance, for each piece of winding with a current in it.

Interesting "observation" ... I'm 46, an RF engineer by profession for
over 25 years, and a licensed ham since 1975 ...

> I am 52, M. Sc. E.E., computer professional, ham since 1962 on 6-160m
> using CW, SSB and RTTY. I did Ph.D. resarch on HF CW computer detection
> until 1991. Let me add few thoughts on the beloved Morse code.
>
> Morse code was introduced 100 years ago as the only form of direct human
> digital communication and it is impossible to defend in the 21st century.

Glad to hear someone who likes Morse, and has obviously studied it at
some length, be that honest about it ...

> It had efficient entropy information encoding using statistical features
> of English language by assigning short symbols to the frequent letters.

The fact that it was based on ENGLISH statistics doesn't play well into
the often-cited argument that Morse is somehow a "universal language"
(which is, of course, a complete pile of bogus dung).

> Our DC-THz tech guru Matjaz, S53MV, professor at Ljubljana University,
> claims the following educational advantages of CW in hamradio comms:

> QSO procedures,

which can be learned as easily or more easily in any other mode ...

>TX/RX protocol,

which can be learned as easily or more easily in any other mode ...

>error detection and correction.

I'm sure that you must agree that modern digital FEC techniques
can easily outstrip the simple contextual error detection/correction
afforded by Morse ... in fact, any non-FEC text mode can just as easily
be checked and corrected in the same contextual manner as Morse ...

> Weak side of CW is poor usage of radio spectrum and power (surprised?).

Not at all ... I have asserted the same thing for many years ...

> Our ears with associated part of brain are so inferior to visual senses.
> The following table sumarises some important radio communications facts:
>
> Modulation type Information speed Bandwidth Efficiency
> ---------------------------------------------------------------------
> Human CW - OOK 10bps 500Hz 0.020bps/Hz
> Radioteletype 50bps 300Hz 0.167bps/Hz

> SSB speech 200bps 2kHz 0.100bps/Hz
> AM speech 200bps 6kHz 0.033bps/Hz
> FM speech 200bps 15kHz 0.013bps/Hz

It is not clear to me where the 200bps number for speech came from ...
Mr. Nyquist would assert that that rate could only handle an upper
frequency limit of 400 Hz at best ... that would result in pretty crappy
audio fidelity ... I would submit that the "effective information rate"
of speech should be much higher, with the result that the "efficiency"
number would look MUCH better than your numbers in the table above ...

However, the *relative* efficiencies of SSB/AM/FM (relative to each
other, but not to the other modes) are probably in the ballpark ...

As the *relative* numbers show, "narrowband FM" is pretty bad ... we
could do MUCH better than NBFM for 6m and up ...

> AFSK/FM packet 1200bps 15kHz 0.080bps/Hz

Yes "traditional" (like we did a decade or more ago) packet radio sucks
big-time, too ...

> Manchester packet 38.4kbps 200kHz 0.192bps/Hz

Manchester causes an unnecessary expansion of the necessary bandwidth.
We can do much better here, too ... the WA4DSY modem does 56kbps in an
occupied bandwidth of about 80kHz at the -30dB points and about 110kHz
at the -50dB points (interpolated from a spectrum analyzer) ...

> BPSK packet data 1.2Mbps 2MHz 0.614bps/Hz
> QPSK GSM mobile phone 271kbps 200kHz 1.355bps/Hz
>
> Note: Manchester and 1.2Mb packet networks are implemented in Slovenia!

Yes, it appears that Slovenia (high-tech power-house that it is)
has substantially more technically educated and advanced hams than
the US. But then again, they don't have the ARRL holding them
back at every turn, either ...

> CW EME uses 1kW RF, 20dB antennas, 250Hz RX filter for 5bps and 3dB S/N.
> Malfunctioning Galileo probe sends signals from 1000 times greater
> distance using only 20W into omnidirectional antenna, RX antenna is 60m,
> information speed is 10bps with S/N only 30 times lower! These modern

> in the simple form of software, PC and SoundBlaster.
>
> PACTOR2 hamradio modem does 1000bps in 500Hz BW, 100 times more than CW!

Yes and will maintain reliable links at levels far below where an OOK Morse signal's presence could even be detected by ear, let alone copied with 100% reliability ...

Source record: 89914
Cross-posted to:
alt.home.repair,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I'd like to use a 12v battery with a charger to power my rigs in my
basement "Ham" shack.
I need the setup to keep the battery safe, both preventing explosive fumes
from building up, and to properly charge and monitor the battery.
I'm thinking of putting the battery in either a plastic tool box that I can
lock (I have a very curious and versatile 2 year old) or in a small pet
carrier (I won't have to drill lots of holes for ventilation in the pet
carrier as I would in the tool box).

Questions:

1. What car, marine, etc. heavy duty battery is best?
Critical Specs
or
Specific Model

2. What battery charger should I use to prevent damage to the battery and
to keep it
properly and fully charged - without generating rf noise in the
process (and to
preferably have a reasonably accurate display of the battery
condition).
Critical Specs
or
Specific Model

Thanks for any help! DavidC

I have built over a half douzen of the danish version TNC2C-OZ, this
is almost the same as the German version TNC-2C, but has some
corrections and the pcb looks much better. The pcb was available
through some sources in Denmark, I believe some more official address
exists, it uses TCM3105 (or TCM3101). Unfortunately it cannot operate
with fm transceiver using open squelch.
I have collected components from different sources and without TCM3105
the cost is somewhere about $15.-
I have also an MFJ1270B and an MFJ1270BT and TNC2C-DL in use.
Main use has been for netrom nodes
I found it to be an advantage (fault finding and adjusting TX
deviation) to have constant audio from the TNC, so the MFJ1270's are
modified for this. I use 110mV RMS into 1000 ohm load for all TNC's.

Great to hear other guys using the old swans!
I put a pot in the screen voltage supply and I am able to run the rig
with it only puting out 5 watts or full power, the pot is a 5 meg ohm
if I recall and when set for low power you can never over heat your
finals and burn them out,even with no ant connected!
6hf5 tubes are hard to get, so are all most any tube that will work.
Good luck finding them!

> or
> Specific Model

About any ( good condition , of course ) 12Volt battery would work
but when you say "best" then I would suggest two (2) 6-volt deep cycle
golf cart type batteries. There is typically only one size, so when
you find "golf cart type" battery, there is only one size, but can be
manufactured by many companies. Connect them together to acheive 12
-13.4 volts. I got mine from Sams Club for $35 each. I have also
used a little $16 , 12 volt garden tractor type battery to power my 50
watt 2 meter rig with success. If you can not find golf cart types,
then any "deep cycle" 12 volt battery would be my second choice.

>2. What battery charger should I use to prevent damage to the battery and
>to keep it
> properly and fully charged - without generating rf noise in the
>process (and to
> preferably have a reasonably accurate display of the battery
>condition).

I would suggest getting a low amperage input model, say 3-4 amps,
maybe 6. Again, Wal-mart, Target, Sears, ect handle these at
reasonable prices.... This charger would simulate a solar powered
setup and if left on 24 hours a day should provide plenty of power to
recharge those 2-6 volt (now 12 volt) batteries mentioned above. I
would strongly suggest you get a on-off timer to be placed between
electric wall outlet and the battery charger. I found an excellent

one at Grangers ($25) that can be set in half hour increments for the full 24 hour day. The timer controls the battery charger so you do not overcharge or boil the batteries. Of course, you will have to experiment a little to find out how much time the charger should be on to maintain your batteries. Last item is a volt meter to gauge the charge of the battery(s). An el cheap-o handheld type ($9.95) will do , and is much better than anyting that would come on a battery charger, or you can hard wire it in and have the face of the meter facing you for ease of monitoring. With this, you can regulate the timer-battery charger better. Suggestion, have the timer-battery charger come on when you are not in the shack so you do not have to worry about rf interference.. The batteries will have or should have enough storage capacity to operate without the charger being on... Depends then on what battteries you go with, right?

Bill de Carle's Web BBS is at http://w3.ietc.ca/home/bill/bbs.htm

The last version of COHERENT (v 4.9) that supported CCW is included in COHERENT.ZIP version 7.2. In my experience copying LowFER and MedFER beacons, COHERENT's CCW mode is _not_ as effective as the unaided ear in pulling weak signals out of the static crashes (at least, not if you start with a good receiver). However, Bill's COHERENT implementations of BPSK _will_ decode a beacon ID when there is no trace of audible signal. If you want an apples-to-apples comparison of BPSK and CCW, try listening for 100-milliwatt MedFER beacons STLMO (St. Louis, MO, 1690.798 kHz) or MIN (Aitkin, MN, 1648.330 kHz). Both beacons send alternating 12WPM CCW and 10-baud BPSK identifiers, approximately one minute of each. The BPSK ID uses VE2IQ's ET (error tolerant) coding. The proper settings for COHERENT are MS100, ET1.

I have obtained a quantity of coaxial cable and am trying to find a good use for it. It is Belden 9207 Twinax------100 ohms-----2 conductors-----.330 inch dia. My question is: What effect on impedance, if any, will tying the conductors together have? Will that halve the impedance value? I think it would make good feedline for a scanner, somehow. Thanks to all.

>
>
Hoo Boy! Typically, some idiot inadvertently transmits into one. Although I have occasionally seen an amplifier under test go unstable and oscillate with enough soup to blow the attenuator. Usually the first stage of attenuation sacrifices itself and protects the rest of the pad. Precision resistors are available from HP, and all you need is a good low temp silver solder to replace the bad ones with. They are swedged in place but can be soldered to if done carefully. 1000 screws on bottom cover to be removed first. The cover with the clip on it is the TOP cover, removal will buy you nothing but a view of the cams.

Web,
I thought Lee only made three different kits, 250/300, 500/600 and
1000/1200 depending on how old your info sheet is:-)
What's this about 1500w? Without crazy IMD you'll not see that out of
the 8-pill, I run one and use double 00 gauge wire to feed it from the
Leece Neville 200A alternator and the Bird still won't read anything
like 1500w.
Rick,
If you need more power, why don't you track down some ex service plasma
generators. hese are made by many US companies and probably several
european ones. They tend to use 50V FET's. My next mobile HF amp will be
using four boards, each with 8-pills each. I'm presently working on how
to charge the bank of four batteries in series to give me my 50V. The
finished unit should pull around 200A @ 50V and bang the Bird to around
5-6KW out.

Good luck.

> of speech should be much higher, with the result that the "efficiency"
> number would look MUCH better than your numbers in the table above ...

I misspoke above ... 200 bps would support far less than 400Hz of audio
bandwidth ... assuming multiple bits/sample and sampling according to
Nyquist's criteria ... I was *thinking* one would have to sample at
AT LEAST 400 samples/sec (bare minimum) to demodulate 200bps (and that
bare minimum approach would make timing recovery and other aspects a bear)
... one would really want to oversample by some reasonable amount ...
but what I typed was sort of "turned inside out" and not at all what I
really intended to say ... I apologize for any confusion I may have
caused by misspeaking ...

# 3775. Re: WWVB to Logic RF Circuit / Chip

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-18 00:00:00 UTC
From: Rick Mainhart <mainhart@sprintmail.com>
Message-ID: <3449533A.3158@sprintmail.com>
Source record: 89851

Brooke,

WWVB has no modulated time code. The carrier frequency IS the time reference, ID is by a 45 degree phase shift at 10 minutes past the hour, returning at 15 minutes past the hour.
Time base reference is typically done by comparing a local oscillator with WWVB directly, and charting the phase difference in picoseconds. To get long-term stability, you adjust your local oscillator to match phase on a day-to-day basis (thus the necessity for a GOOD STABLE oscillator).

The phase difference is so noticeable, that with commercial WWVB equipment onboard a Coast Guard Cutter (1979-1980), we could see a course change by the phase chart recorder! We used the master oscillator to feed our transmitters and receivers to keep them all within the alloted frequency allocation ... HF through UHF.

The company that made the equipment is (was?) in Rochester New York, but their name escapes me.

IMHO, you can purchase an inexpensive GPS receiver with time-code output for far less than you can buy or build a WWVB receiver/chart recorder. Another inexpensive option is to use the broadcast television time interval signal reference transmitted on one of the blanked horizontal sweep lines ... time code is imbedded, is traceable to NIST standards, and was written up in one of the ham radio or general electronics magazines several years ago.

There was also a nice article on using LORAN-C as a time-base. LORAN-C is traceable to NIST and is generally good for 1 X 10-13. Receivers are inexpensive, extracting the timebase data is fairly straightforward ... written up in one of the ham rags a few years ago.

If that isn't what you want, then you can extract the 100 Hz subcarrier BCD time code information from WWV, which is how Heathkit's "World's Most Accurate Clock" worked. Probably can build all the detection and display hardware into a PIC processor ... and with a 7.5 MHz local oscillator, easily receive 5 and/or 10 MHz by switching passband filters in/out.

If you need more information on WWVB, you can read a very informative page at http://www.bldrdoc.gov/timefreq/pubs/sp432/s_wwvb.htm. They also point you to the time code data in an appendix.

Hope this helps.

73,

Rick, WB3EXR

# 3780. info needed on voice inversion company

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-18 00:00:00 UTC
From: "Witek G. Busse" <witek@argus.rs-systems.com>
Message-ID: <34499379.7C90FEC@argus.rs-systems.com>
Source record: 89856

I was web surfing and found a British company that sells voice inversion IC also I think they sell packet radio chips. The problem is that I forgot their web address. The only things I remeber is that their voice inversion IC were HIGH TECH not the plain jane. Even though they were analog there voice scrambling was not only plain voice inversion but also time based? They sold several types, from plain inversion to military grade encryption. They have a US dealer which also has a web page, but I cannot find it either. If any one could help me find this web page or even the name of the company I would greatful. Thank you in advance.

i tried running a wire antenna all the way up the ceiling
and got some killer results. also you might want to try this...
run the wire from a loop or wherever the slack is, to the wall
going straight up towards the ceiling. then fasten some kind of
steel or metal object to the upper part of the wire.
i have a piece of thin cut metal clipped on mine with a clothespin
and can pick up a lot more stuff than i did with a standard
mount antenna.

Hi there!

I'm locking for any program to program the GP300 with!
I have the rib, but i need a program that i can use with my 2m radio. I have a program that works fine on the hi 70cm band, and I have a program that works on frekv over 146MHz.

I'm now locking fore a program that supports frev. below 146MHz.
Do you perhaps have any program that supports what I'm looking fore, ore maybe you know someone that might have it?

Many thanks, and I hope that you can help me!

/Kenneth

Source record: 89767

The 148 is likely a good candidate to change...IF I recall, the 148 uses the UDP divide by chip.....the same chip in my Yaesu FT227R...it is BCD controllable and we once had a 148GTL on 10mtrs as a BCD controlled remote base from our 440 rptr....was great working 10SSB from the UHF HT....
To go to six, all that is neccessary is to change the xtals and retune the RF stages (may need some caps changes)....
Would be neat now that 6 is becoming a true world wide band and the sunspots
are on the way up again!

That's Ok, you're still confused anyway. What the table is showing is
the bps equivalent of the *words per minute* conveyed by speech.
That's the information content being measured.

Rick:
The TV Vertical interval time-code is not dependable, as many
programs are delayed and may contain time code that is several
weeks old and many hours off. Also during commercials the time code
may or may not drop out.

Another myth that the Color Burst Freq(3.579545mhz) is
dependable.
Since the advent of satellite program distribution all Color Burst signals
come
from the stations sync generator. In most operations this has not been
adjusted
since the generator was manufactuered. The tolerance is +- 20 HZ, so they
aren't very close. Some stations have this freq monitered, most don't.

There was a time when the networks used Cesium standards on the
Color Burst for stablilty before the availability of good Frame Sync's. This
was abandoned at least 15 years ago.

The time coming out the NMEA port of inexpensive GPS receivers is only
trustworthy to +/- 1 second. Internally, the time is much better, but you have
to hack the receiver to get it. There are some board level GPS receivers which
can be used. Tom Clark's Totally Accurate Clock (see TAPR's webpage)
extracts this signal and gives you an accurate time reference.

>Another inexpensive option is to use the broadcast television time
>interval signal reference transmitted on one of the blanked horizontal
>sweep lines ... time code is imbedded, is traceable to NIST standards,
>and was written up in one of the ham radio or general electronics
>magazines several years ago.

PBS sends a time signal, but again it isn't trustworthy to more than
+/- 1/30th of a second, often quite a bit worse. That's due to the use
of frame synchonizers internal to the station which resynchronize
the network signal to the local station's house reference, which is
usually a simple crystal oscillator. Frequently, the signal may be
routed through more than one frame sync, each of which adds
another 1/30th of a second delay. Or it may be routed through a
production switcher which adds another delay of up to 1.5 TV
lines, about 100 micoseconds. And this can change moment by
moment depending on requirements internal to the broadcast
station. This signal is intended to resync the clocks in Sony TVs
and VCRs (Sony is paying PBS to distribute it), and is not intended
to be a highly precise time reference.

The other networks also sometimes embed timecode in the
vertical interval, but this is time into the program, and not
real time. Network programming is distributed to the affiliates
via satellite, and feed origination points may change from
program to program, IE one show may come out of NY,
another out of Washington, and yet another from Burbank.
And they may take a different number of satellite hops
along the way (turn arounds we call them). These all create
differential delays. And of course there is still tape delayed
broadcasting whose embedded time code is obviously out
of date by hours, perhaps days.

These network timecodes may not be rebroadcast in any
event. Local stations are now permitted to resell the vertical
interval of their signals. Many do. They strip out the network

signals and insert their own local signals. A number of for pay services are now transmitted in the vertical interval.

In the old days, when distribution was by terrestrial microwave out of NY and there weren't any frame syncs at the local stations, you could figure out the offset due to transmission path delays and derive an accurate time or frequency reference from the network signals, but that has all changed now. Distribution is via geosync satellites, and those aren't really geostationary. They introduce a doppler error of a few parts per million. And transmissions may be dynamically switched. This precludes local stations from genlocking or they'd find their local in house production work disturbed by these dynamic switches.

The received signals are then frame synced at the local station to bring them into time with the local station reference so that transitions to and from the network will be seamless and so supers can be put over the network signal. A frame sync introduces a 1 frame delay, (+/- the difference in frequency between the signal and the local station reference at the moment). For production purposes, the signal may be routed through other delays from time to time before being transmitted. You can't know this, so you can't develop an offset to compensate for it.

You *may* notice if frame syncs are cascaded. The lip sync gets off because the audio is not delayed but the video is. To solve that problem, stations are now adding audio frame delays to bring the programs back into lip sync. We recently had to do this for in-house purposes because our new studio uses a digital component switcher which is defacto a frame sync. That extra delay made lip sync errors noticable and we had to add an audio frame delay to bring things back in sync.

In summary, if you want an accurate NIST traceable time or frequency reference, you won't get it from broadcast TV. That was attempted years ago, with the three networks (before Fox and PBS) using rubidium references in NY referencedto NIST and local stations slaving their references to the network (called genlocking). But those days are long gone. Changes in broadcast technology and distribution mooted any traceability.

A few broadcast stations use rubidium standards for their transmitters, or for their house references, but these aren't NIST tracable, and are generally not being replaced with similarly precise references as they are retired from serivice. The FCC only requires broadcasters to maintain a frequency precision which is easily obtainable from a normal crystal oscillator, so the rubidiums are more trouble to maintain than they are worth.

>There was also a nice article on using LORAN-C as a time-base. LORAN-C
>is traceable to NIST and is generally good for 1 X 10-13. Receivers are
>inexpensive, extracting the timebase data is fairly straightforward ...
>written up in one of the ham rags a few years ago.

Loran C is being phased out in favor of GPS. It is scheduled to begin shutting down in 1998. Omega has already shut down (that was a better reference than Loran C). It is coming down to WWVB or GPS if you want an accurate time reference. WWVB is currently going though an upgrade to boost its transmit power to improve coverage, but there are still areas of the US where reception is difficult.

GPS is globally available. Due to the SA dither and the varying propagation delays through the atmosphere, GPS time isn't that locally precise, but if you have a way to locally average it, you can reduce those errors to a reasonable value, IE you can use the signals to discipline a local oscillator. That's the idea behind the TAC. This gives better accuracy than HF WWV because HF propagation variations are much more extreme than those experienced by GPS.

HAMFEST October 26, 1997 Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
LONG ISLAND HAMFEST-COMPUTER SHOW - OCTOBER 26, 1997

LINDENHURST, LI - NY

On October 26, 1997 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the Knights of Columbus Hall located at 400 South Broadway, Lindenhurst, NY.

This is an ARRL approved Hamfest.

There will be radio equipment, electronic componets, computers and access-ories, softeware, books, technical manulas, ARRL information, Amateur Radio License Exams and information. General admission is $ 6.00. $5.00 with coupon. (Coupons will be available at the door.)

For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam seesion. 1996 ARRL/VEC fee is $ 6.25, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

For vendor and additional information pleas contact, Walter Wenzel KA2RGI at (516)957-0218, or Tom Carrubba KA2D at (516)422-9594 during EVENING HOURS ONLY (7PM-10PM). NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the limited space available. Tables are 2.5ft x 6ft.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL and 223.86 OC.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

I have the below listed Ham Radio Magazine mags to give away. There are not many of these but as I am able to go through things I will offer many more. All I want is the shipping for them. The first person who e-mails me and says he/she wants these I will accept. Then they should send me enough postage to get them shipped.

Here is the list:
June 1971
August 1972
August 1973
January, Feb, Mar 1976
October 1981
April, Sept, Oct, Nov 1982

These weigh about 4 lb and I do not have them in a package for shipping. I will probably have to buy a large shipping envelope from the post office.

I also have a Heathkit assembly manual for the reflected power meter and swr bridge. This is model HM-15.

The same applies on shipping for this. It is only about 15 pages and is just about the same size as the new QST mags. I did not weigh this as it is quite light.

There will be many more mags 73, CQ, and QST as I am able to unpack them. As I am retired, disabled, and diabetic it may be a slow process but I do want to send them off before I am forced to leave them sit.

I hate to say it, but the easest way is probably to go to Radio Shack and part with $40 and buy one of their radio controlled clocks.... They seem to use the wwvb time code info to drive a nice little time of day clock. They seem to be (I'm guessing here) using a fairly sophisticated dsp receiver which I can say is pretty effective. I live in an area where bith wwvb and loran are virtually useless due to serious power line noise and yet the RS clock sits there displaying the time... I'd like to know how they do it!

Well, sir,
I for one have not seen this piece of legislation, but, unless it directly affects Amateur Radio then good luck trying to get the Amateur Radio "community" to listen to you and help out the people that want to continue to be able to listen to other services. The amateur "community" has nothing else but it's own interests at heart, this includes if it reduces other people's ability to hear EMERGRENCY communications which may directly affect the life (lives) or property of those who would be (illegally) listening to police, fire, paramedics, cellular, etc. If these people would get off their duffs and let their congressman (woman) know how they felt there would be no threat at all to either the rights of hams or others to listen to whatever they want to, whenever they like. By the way, the way around the "scanner ban" is to buy your equipment from dealers in Canada!!!!!

The name of the company was probably Spectracom. They are located
in Rochester and make receivers for WWV and Loran and other equipment
for time and frequency standard use.

I understood thet WWVB amplitude modulated their signal with a slow
data rate with time and perhaps other information. Haven't checked
latly so can't say for sure.

Ross "codeman" N7VWX gave some practical advice in a separate posting. I'd like to offer a few variations on the theme.

The "best" battery may depend on how you operate. If you expect to be discharging the battery many times (versus keeping it continually charged to full/nearly full capacity), then you need a deep cycle battery. I use a Sears marine deep cycle battery (12 V) in my shack. I thought it provided the most amp-hours for the buck. If you rarely or never do deep discharges, any automotive battery will do fine. Be advised that the deep cycle batteries usually have a weaker sulfuric acid inside (specific gravity about 1.25 vs 1.28), so their resting voltage is somewhat lower than the auto battery's (12.7 vs 13.2 V). There's nothing wrong with this, but it does affect the charger settings you should use for a float charge.

I use a variable-voltage homemade linear power supply (4-A nominal) to keep the battery charged. It has no make or model number, but it also has no RFI. After a significant discharge (either type of battery), it should be charged for a while at 14 to 14.5 V with current limiting to 4 - 6 A. If you don't do deep discharges, you can maintain either battery on float charge (about 13.2 V for the deep cycle, 13.6 for the auto (I think??)).

I use a hydrometer to check the battery. Reading the voltage is fine for day-to-day monitoring, but you need to know the strength of the acid when the battery starts to go bad. I successsfully revived my last battery when the voltage readings said it was in steady decline, but the hydrometer said it just needed a high-voltage charge.

I can't remember the Web pages, but there are some good ones around on batteries and charging. I recommend that you try a quick search.

Source record: 89784

Last week I was looking for a source of high voltage/power transformers.
Replacement should be here next week from Peter Dahl.

I still have the 3 bad transformers. Hopefully the secondarys are bad.
I plan to remove the secondary wndings and replace them with the correct
number of turns to build the mother of all 13.8 volt DC power supplies.

The old transformers are rated @ 2500 vac 4kw, and weigh 70 lbs.
Does anyboby know of a method to determine which winding is bad on a
transformer?

Source record: 89787

Stereo Sound Transmission

Hi,

With a mono transmission only the sum of the left and right (L + R) signals is transmitted but with stereo the difference (L - R) is also sent out. Now if you do some basic analogue arithmetic in the receiver you get :-

[(L + R) + (L - R)]/2 = L (the two R's cancel out)

and

[(L + R) - (L - R)]/2 = R (the two L's cancel out)

So there you have your separate Left and Right signals.

To work this magic a low level pilot carrier is generated at 19kHz. The (L - R) component is amplitude modulated onto the subcarrier's second harmonic of 38kHz to produce a double sideband suppressed carrier signal. This along with the (L + R) signal, and the 19kHz pilot, are all frequency modulated onto the main carrier. The purpose of the 19kHz subcarrier is to help recover the (L - R) part signal from the DSSC signal - a sort of a BFO if you will.

I hope this helps.

> > Modulation type Information speed Bandwidth Efficiency
> > ---------------------------------------------------------------------
> > Human CW - OOK 10bps 500Hz 0.020bps/Hz

This table bothers me. Bits is a useless parameter for comparing.
Characters or sylables would be better.

Assuming PARIS which is 34 bits long, this would be 17.6 word/min. It
is about 6.8 bits per character. Baudot is 7 bits per charector with 5
having any meaning to the text.

A 500 Hz Morse channel would be able to handle much more than 17.6 wpm.
I don't remember exactly, BUT I think a 10 bps Morse channel would
require about 28 Hz. This would be 0.357 bps/Hz. This factor would be a
constant for all code speeds. (Actually, I think it is sqrt(2)/4) I'll
have to look this up.

Voice typically takes at least a couple kHz. The intellegability is a
function of bandwidth. The narrower the bandwidth, the slower you have
to speak to be understood.

Uhh, typically we use an ohmmeter.

You should see essentially infinite resistance to ground from
all terminals on the transformer (unless a ground tap is provided),
a series resistance on the primary that is consistent with its
power rating (a few ohms, typically), and infinite resistance
between any primary and any secondary terminal.

If you're lucky, the primary is the inside winding. Disassemble the
core laminations, discard the secondary, and wrap about 20 turns
of #18 stranded insulated wire on the primary. Reassemble (not
COMPLETELY) and apply primary voltage. This will give an approximate
turns/volt rating for the secondary. Now calculate how many turns
you need for your desired voltage, and the largest size wire you
can use. I've successfully rewound lo-volt secondaries with
paralleled windings made from discarded 12 ga insulated electrical
wire. If you have the bucks, there is a square enameled wire made
specifically for motor and transformer winding, in sizes up to
8/0, I believe (like 5000 amp service).

Have fun!

: How does A stereo FM transmitter transmit the seperate audio channels.
: Simple question right?

Sure, fairly simple. (L+R) comes on the "normal" audio modulation channel.
(L-R) comes as a double-sideband modulation on a 38kHz suppressed carrier,
and that is simply mixed with the baseband (L+R) signal. There is also a
"pilot tone" at 19kHz, so that if you double the 19kHz and get the phase
right, you have the carrier that must be re-inserted to demodulate the
double-sideband signal. Once you have (L+R) and (L-R), it's easy to add
and subtract them to get (L) and (R). So...with this system, a receiver
that ignores the dsb (L-R) signal will still get (L+R) in mono.

Just curious, why do they use a double sideband, suppressed carrier at 38khz...why don't they just make it a normal AM (L-R) signal at 38khz? Why even need a 19khz pilot then? If it was just a 38khz AM signal it seems like it would be less complicated then going through the trouble to generate a 19khz pilot, doubling that, AM'ing the 38khz, supressing the 38khz carrier, blah, blah....

# 3826. Re: FM Stereo, How does the seperate channel audio work?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-20 00:00:00 UTC
From: mzenier@netcom.com
Message-ID: <mzenierEIEwK8.EL2@netcom.com>
Source record: 89803

In article <344A3CAD.45C4@mwt.net>, Joe Mayenschein <mayen1@mwt.net> wrote:
>I know this isn't really the place to ask this question but I haven't
>found any place better to ask it. So here goes.
>How does A stereo FM transmitter transmit the seperate audio channels.

There are two ways to think about it.

A timewise way to look at the multiplexed signal is that every 1/76000
of a second, an alternate left or right channel is sampled.

```
r
r l r
rl l r
l r rl
r l
l
RLRLRLRLRLRLR
```

Looking at this frequencywise, it breaks down into two components
(after being lowpass filtered). The low frequency component of
the combined signal is the sum of the left and right channels. The
ripple on the top of the envelope of the signal becomes (a cycle for
every two alternate samples of) a carrier (at 38 kHz) modulated (with
signed multiplication) the amplitude difference between the left and
right channels. Another way to call that is Double SideBand modulation.

Added to this signal is a 19 kHz pilot tone to phase the demodulation
so that it can determine left from right.

You can use either alternate sampling, or a summing and differencing
and an analog multiplier to generate the signal. I gather that most
quality equipment uses the seperate analog multiplier scheme, but the
low cost single chip FM multiplexers (and transmitters) used in wireless
CD to radio adapters and wireless microphones from Rohm and New Japan
Radio use the sampling scheme.

>John Phipps K7BTA

It runs about 1.3 - 1.35 volts immediately after charging, then will drop
to about 1.25 volts over time. While charging at C/10 or greater, the cell
voltage can be as high as 1.5 volts.

Actually, I was going to let him slide on it ... this time <grin>.
But I do take exception with some of his other comments below.

> I know that you mean the portions of the data segments of the HF bands
> where CW has been traditionally used, however, and won't make an
> issue of it. But I will note that we can go narrower with some digital
> modulations and codings than we can with OOK Morse, so if packing
> them in like sardines is what you want, that's the way to do it. But we
> have to lower the data rate down near that of OOK Morse to do so.
> And that's just what VE2IQ and his gang are doing.

And if one wants to be narrow and slow, that's fine ... it doesn't
*have* to be orders of magnitude faster than OOK Morse to be more
efficient in its use of spectrum, though it *can* be (in terms of
bits/sec/Hz, which is the only valid metric of spectral efficiency).

> But there are other ways to multiplex use of scarce spectrum than
> by going narrower. Especially for things like working Dxpeditions
> where speed and number of contacts per hour are important, use of
> relatively high speed digital techniques in an ordered TDMA que is
> much better, and much less chaotic. This does require cooperation,
> however, something often lacking on the HF bands.

This argument, while true, runs into that "If I can't dig it out
by ear, it's not a 'Real Contact'" argument, though, right? I guess
folks like Larry can only be expected to claim that "Only 'Real Hams'
(who, by their standards must beep) can tell what's a 'Real Contact'
and what 'isn't'." (NOT)

> Or, use of SS technique can allow us to share the spectrum in a more
> efficient way while also giving us another tool to deal with severe multipath
> problems. The spreading bandwidth is too small to give us huge coding
> gains at HF, but other attributes of SS still make it attractive as an

> is often lacking on our HF bands. SS maintains packing density
> automatically by maintaining a flat spectrum across the band, so less
> overt operator cooperation and coordination are required to maximally
> exploit the available spectrum resource.

I still haven't figured out a way to convince some of these guys that
just because a signal is as wide as a band, that doesn't mean that it
precludes the use of the *same* band by others at the same time. There
have been many (to me) clear, concise, and intelligible explanations of
that principle, but many still seem not to be able to "get it."

> >8) The approach that I and others are advocating is to **OPTIMIZE**
> >Morse code usage as a desirable alternative to eliminating it,

You (Sabin) are the only one who keeps harping on the "elimination of
Morse." (in this thread ... other pro-coders toss the same red herring out
in other threads, though, but I've not seen it from a "no-coder")
I've stated many, many times that that is NOT *my* goal, that I would
not support any movement to band the use of Morse, and that I firmly
believe that Morse usage will continue for decades, perhaps "forever,"
even in the absence of forced learning and mandatory testing.

> >for the
> >very precise reason that in the crowded HF CW bands it makes a lot more
> >sense than the wider bandwidth alternatives.

You keep stating that as if it were some sort of "fundamental truth" ...
that is clearly NOT the case ... saying it over and over will not make it
come true (not even if you click your heels together 3 times).

> >If you listen on 20 meters
> >or on the commercial/military frequencies you find that a data station
> >takes up much more spectrum than a CW station. This illustrates the
> >problem very clearly. A high speed data stations completes a message
> >faster, but creates wideband interference. A CW station takes longer but
> >creates less interference.

If the efficiency of the "data system" in bits/sec/Hz were (only) identical
to the OOK Morse system (it is *highly* unlikely that any operational data
system would be so poor, but I'm willing to take that "handicap" for the
moment for the sake of making a point), the "interference potential" would
be identical ... it's a time/bandwidth/data_transfer product as far as
efficient usage of the spectrum is concerned ... the idea that a slower Morse
transmission is somehow "more spectrally efficient" than a faster, but
proportionally wider, digital signal of proportionally shorter duration is
patently bogus. This "dealing from the bottom of the deck" approach to
analysis is one of the primary reasons that I object so strenuously to most
of Sabin's posts.

> The wideband interference is a greater problem, in practice.

Baloney ... see above.

Only for stations "stupid" enough to be "victims" ... Gary's comments vis
a vis "time-sharing" are something that you seem to continually ignore ...
I think it's because you're desperately trying to find a way to "bring
Morse up to date," but the problem I see with that approach is that you
always seems to "assume" that Morse is somehow the "superior" or "preferred"
mode that "must be protected *at_all_costs* from 'all those evil' modes."

> >9) There are those who have examined the bit error rate vs S/N ratios of

OK you radio/amp detectives, here's one for you work on:

I have recently acquired a homebrew amp, that appears to be built as a push-pull circuit. It has a 6CL6 as a driver, with 2 6KD6 sweep tubes as finals. My questions are this: how much power should be used to drive this amp? What would the approx. output be?
Also, there is a plate and load adjustments for both the drive and final. I assume this is to peak the driver tube and then the finals after for max output. This amp has no band-switch, so I don't know what band(s) it will work on, any ideas?

There's also some good circuits on the Internet. However, some are so pathetically simple they don't work particularly well, but they are at least a starting point. Check my QRP website (URL below) for links to pages with schematic diagrams of DC receivers.

A good DC receiver design is a NE602 detector, 741 AF preamp and LM386 or CD4007 or similar audio amp. A couple of 741s as an audio low pass of band pass filter will be worthwhile. As for the choice of band, I'd go for 80 or 40 metres.

I read the original Collins paper on this years ago. The reasoning was all there. To keep it simple, DSBSC was chosen because there were a number of ratio detectors in use at the time. Some of these ratio detectors don't care whether there is AM/FM or what. AM would produce products in the base band. The Collins system was compatible with all existing detector schemes. Some of the competing systems were not always. At least one of which had an FM subcarrier and at least one had an AM subcarrier.

Large non-inductive 50 Ohm resistor for large dummy load.

Carborundum 275 watt continuous,
50 Ohm 5%,
non-inductive

12" long, aluminized ends, 1" diameter.

Brand new, never used or placed in-circuit.
Could be used for 1000+ watt air cooled, or,
2000+ watt oil-filled dummy-loads.

A MUST for QRO operators!

$30 dollars + $5 for shipping.

> blah, blah....
>
>
When you draw or measure the modulation waveforms of a stereo FM system, you discover that because they used a suppressed carrier, you can sample the composit audio waveform at the correct instant to recover the audio channels. In other words, recovering the audio in each channel does not require using filters to seperate the different components, demodulating them and then combining the results. All that is required is to sample the composit waveform and low pass filter the result. If you review the schematics of most decoders, they make use of this principle.

Another reason to avoid the use of AM subcarrier modulation is that the carrier will use up valuable modulation capability. The FCC or other authority will allow FM stations only so much (75 kHz peak in the U.S.) deviation and the operator wants to use it for his audio signal, not waste it on a subcarrier. The broadcasters rule is loud is better.

Brooke,

An excellent 3 part article by Bob Roehrig on building a
WWVB receiver can be found in the Jan/Feb/Mar issue of '73
magazine.

The old HP 117A VLF receiver has a signal level output that
can be used to decode the subcode. The manual has an example
where a strip chart recorder is used to decode the signal.

See http://www.bldrdoc.gov/timefreq/pubs/sp432/s_appc.htm
for a description of the 60 second WWVB time code format.

See http://gorzarg5.phy.bnl.gov/~scott/radio-clocks.html
for a bibliography of time and frequency radio receivers.

Perhaps the easiest way these days is to extract the raw
subcode from one of the many battery-powered desktop WWVB
radio clocks on the market.

I have been unable to decode the VLF receiver output of
the Oregon Scientific, Brookstone, or Junghans WWVB radio
clocks, but have had great success with the Arcron Zeit.

There are two ICs inside the desktop model of the Zeit:
one is the 60 kHz VLF receiver and the other, hidden
under the LCD, is the uP which decodes the 1 Hz subcode
and drives the display. One of the traces that runs
between the two ICs is the receiver enable and the other
is the 1 Hz subcode output. Logic low (0 V) on this line
corresponds to full WWVB power and logic high (3 V) to
10 dB reduced power.

When the receiver is on and reception is good the 0.2,
0.5, and 0.8 second width bit frames are clearly visible
on the 1 Hz subcode output. This output can be sampled

and decoded by a PC or microcontroller (such as a Basic
Stamp).

At the end of June 1997 I used this technique to observe
how WWVB handled the leap second. In the following log
the date and time are PC local time (PST), "P" indicates
a frame or position marker (0.8 second of 10 dB power
reduction), "1" indicates a binary one (0.5 second power
reduction), and "0" indicates a binary zero (0.2 second
power reduction):

73!
I'm trying to build a timer ( possible a 555 type timer ) for a staging system for a model rocket that will carry a foxmitter. My problem is the saftey factor. The switch I'll use will engage when the rocket is moving. But if I drop the rocket before it will set off the timer! What I need is a way to have the timer start after the switch is engaged for a half second or so. Can you help?
Thanks!

: it would be less complicated then going through the trouble to generate a
: 19khz pilot, doubling that, AM'ing the 38khz, supressing the 38khz carrier,
: blah, blah....

For one thing, I think it's relatively much easier to make a very low
distortion detector if you inject a carrier, than if you just do an
envelope detection. Note that the carrier in this case is not far
above the bandwidth you want to pass...envelope detectors get tricky.
Also, you don't have a really big 38kHz signal modulating your transmitter
all the time, so you have more of the available FM broadcast bandwidth
available for interesting signals; the 19kHz pilot tone is at only about
8-10% (if memory serves) deviation. Detection is actually pretty easy,
given the pilot tone; it's not nearly so complicated as a synch. AM
or DSB detector where there is no pilot.

John,

Howdy, I read you post in the homebrew newsgroup. I think I can help you out. I thought your need for a switch delay would be a nice little challenge, I am a EE student at MSU. Anyhow, I designed a little circuit around a LM-741 op amp that is adjustable to delay a switch from .015 to about 3.5 seconds. It runs off a 9 volt battery, which is the power source I assumed you were using, if it needs to be changed it can be done easily. After the power is applied to the circuit, it delays for the set time the provides an 8.7 volt DC output, with a max current draw of about 200mA. If you need a higher current limit, that can be easily modified as well. Your timer circuit can be hooked up directly to the DC output and will start timing after the delay has passed. Let me know if you need a good timer circuit as well, I know a bunch of good ones, I can draw one of those up to. I would be glad to e-mail you the schematic, it was drawn using Microsim Schematics, ver 8. If you dont have that, I can mail it to you via snail mail. Is your address good on the www.qrz.com book? Anyhow, let me know if you would like it, I'd be more than happy to help.

There is a catch. The 75A1 is a fixer upper. On a scale of 1 to 10 is rates about a 7 to an 8. The audio gain pot does function but also free spins. There is no output from the rcvr other than white noise. It needs cleaned up. The pots are "noisey" as well as the switches. The tuning dials and scales are very very nice. Not tinted yellow but clear. The dial cord works fine. There is minor corrosion on the inside of the rcvr but the chassis is not rusted (looks like really old dust and dirt). No holes drilled to the top, front, or sides of either the 270G-1 spkr or to the 75A1 rcvr. I have the original manual and it is in pristine condx. The rcvr weighs 57 pounds and the spkr weighs 9 pounds minus boxes and packing. The rcvr and spkr would clean up to about a 9 w/o new paint. With new paint they would both look new.

The TS-930SAT works like new. Recently aligned by a San Diego engineer. S/N is in the 2 mil range. Gen. coverage xmit has been enabled for MARS ops. cosmetically the main tuning dial paint has rubbed off.

I would like to trade the Collins and Kenwood gear for a TS-850SAT.

>be checked and corrected in the same contextual manner as Morse ...

I prefer Morse method with a string of dots instead of usual DEL key
when correcting TX errors and deep search of audio memory for poor RX!

>It is not clear to me where the 200bps number for speech came from ...

Pitch rate of normal speech which carries information is in this ballpark!

>Mr. Nyquist would assert that that rate could only handle an upper
>frequency limit of 400 Hz at best ... that would result in pretty crappy
>audio fidelity ...

This is exactly what we achieve with DSP MIPS in speech comms these days!

>> Note: Manchester and 1.2Mb packet networks are implemented in Slovenia!

>Yes, it appears that Slovenia (high-tech power-house that it is)
>has substantially more technically educated and advanced hams than
>the US. But then again, they don't have the ARRL holding them
>back at every turn, either ...

Surprisingly it has per head of population :-) And our S53MV was bored in
USA while on Fulbright scholarship in Boulder, CO! He does AMSAT as well.
The only problem we had with ARRL was that 1.2Mb homebrew packet radio was
not published even in QEX. Curious souls may find it at www.hamradio.si .

73 de Mario, S56A, N1YU.

P.S. I hope the following kind of comments will not appear again as I try to keep this thread light while seriously participating at hfsig@tapr.org!

John
You should get a book on model rockets, the ones that I have build used the separation charge
in the first stage to light the second stage. This is much safer, if the first stage does not start or
you drop it nothing happens. As to time delay the engines come with various amounts built in

OK ... though I think what you propose below has been covered
innumerable times already.

> Why not do a study
> on Noise(dB) vs Signal Intelligibility,]

Modern digital modes win hands-down ...

> Propagation effects(QSB) vs Signal Intelligibilty,

Modern digital modes win hands-down ...

> and Equipment Cost(Minimum requirements) vs Information rate.

Modern digital modes win hands-down ...

> These are more realitistic concerns, than how fast a message can be
> transmitted or received., especially when using HF.

Why? (Even though Morse loses on the above-listed counts, I am curious
why you think so.)

> I think a good CW
> operator can get a message transmitted faster than Voice and certainly
faster
> than digital data when the band is starting to close during a thunderstorm.

You are welcome to insist on holding that view, but your persistence in
adhering to falsehoods doesn't make them true.

> I
> agree that at VHF, CW is probably inefficient, but there is still no
> comparison at HF when considering the above criteria.

Why is there any difference in "efficiency" between VHF and HF???

> Morse still has its place and always will,

I agree with that one ... some minority of hams will probably always
enjoy Morse and/or cling to its use as "tradition."

> pounding brass is the spirit of Amateur radio,

That is little more than dogma.

> where a HAM is judged on how accurate and precise his fist is

That is sad, but too often true ... technical knowledge and skill
should be the primary metric of accomplishment and "value" in a ham
because it's *supposed* to be a primarily technical/experimental service.

> rather than on how much
> money he can fork out into a super-modern, 15 Mode, techno wonder
> transceiver.

I agree that there is no merit/accomplishment in being just a rice-box
operating appliance operator ... however being able to design and build
something modern, efficient, and technical should be the most highly-valued
skill a ham could possess.

Hello, Bryan--
The 7036 appears to be nearly identical to a 5915 heptode, but it (the
7036) is packaged in a taller envelope and according to a Sylvania tube
manual, offers 0.9 W plate dissipation compared to 1.0 W for the 5915A.
A 6BE6 has the same pinout.

Tom,

For awhile I've been interested in using WWVB's 60KHz carrier as a frequency reference. Do you know if this signal (amplified) is accessible in any of the commercial receivers?

Also, what kind of antennas do they use?

Thanks!

- Jeff, WA6AHL

P.S. Anyone tried making an accurate frequency reference using the 1 PPS pulse from, say, the GARMIN GPS engine?

# 3868. Morse code reception

This is a repeat of a former article. I want to repeat it for anyone who might be interested and missed it the first time. My opinions on this subject have not changed.

Bill W0IYH

--------------663E24B85158
Content-Type: text/plain; charset=us-ascii; name="morse.txt"
Content-Transfer-Encoding: 7bit
Content-Disposition: inline; filename="morse.txt"

The purpose of this article is to encourage the homebrew experimentation

with methods for improving the reception of weak-signal Morse code on

the Amateur Radio bands. The motivations for this are the following:

1) Morse code, also known as on-off-keying (OOK), irrespective of other

interests in speech modes such as SSB and relatively complex data modes

of numerous types, is still, and is expected to remain, a mode of great

worldwide interest in Amateur Radio.

2) Manual CW operation, using very simple eqipment, both transmit and

receive, especially low power (QRP) equipment, and without computer (PC)

assistance, is easily accessible to individuals of limited technical and

financial means. CW has always been the "common denominator" mode in

Amateur Radio.

3) CW operation is conducted within very narrow bandwidths, which means

that a large number of stations can operate simultaneously within narrow

Amateur sub-bands such as the HF CW bands.

4) There are many operators who enjoy the CW mode, and want to preserve

it, in addition to the more tehnically advanced modes that are now

available.

5) Morse code is a signalling method that can easily be "mapped" from dot-dash symbols to a local language such as English, German, etc. In other words it can be translated mentally by the operator without machine assistance.

From a purely technical standpoint, Morse code has limitations, relative to other "waveforms" such as FSK and a large number of phase-coherent methods. FSK requires two separate frequencies, Mark and Space, usually separated by 170 Hz. This means that conventional FSK usage doubles the band occupancy and requires *two* clear receive frequencies for perfect copy. As an alternate to this, CW mode can be received at slow speed on a *single* frequency in a very narrow bandwidth. And very simple equipment is adequate for this purpose.

In a noise background, FSK is more effective partly because there is always a signal present. CW mode, on the other hand, has to deal with "key up" (no signal) states, in which the absence of signal may imply a fairly high noise level. To the human operator these key-up states are significant information because they "separate" dots and dashes, characters and words. In other words, key-up is at least one bit of information. For example a dot followed by a space (key-up) is a two bit message and a dash is a 4 bit message (A.S. Chester, MIEE, G3CCB, Wireless World, August, 1983). Also, sometimes offsetting some of the advantage of FSK is the fact that *some* CW transmitter designs are capable of 3 dB more long-term peak power at the 50% duty cycle of CW. It is also true that FSK must also distinguish between the signal on one frequency and the noise on another frequency. This is identical to the CW problem that I just mentioned. Still, at a very low signal-to-noise density ratio (S/N0) FSK offers an additional advantage in error rate (Carlson "Communications Systems", 1975).

Phase coherent methods such as PSK, MSK etc. offer much more improvement. The problems with these methods involve A) the complexity

of the equipment and B) the very difficult problem of maintaining phase coherence, especially at HF. This is the realm of truly advanced technology that is not readily accessible to most amateur operators.

In view of these considerations a very desirable goal, from a specifically *Amateur Radio* standpoint, would be an experimental homebrew effort to develop a Morse code CW system that would A) greatly improve CW reception under weak signal and interference conditions and B) permit "interoperability" (buzz word) with CW operators who are *not* equipped with the advanced system, so that *anyone* can copy the CW signal under conditions of adequate signal levels and interference and with moderate code speeds.

How can this be accomplished? There are many approaches that could be considered. One European CW expert reports a German design that works quite well. I do not know how that system works. One basic approach could be to store a number, perhaps 10, of consecutive bits, both key down and key up, and use software decoding of these bits into dots, dashes and the three different space intervals, into alphanumeric on-screen text.

The main exercises are to A) distinguish signal from noise, just as in FSK, and B) to determine dot vs dash and the lengths of the spaces. Part B is more difficult than FSK and requires some special ingenuity, but I am sure it is definitely feasible (do-able).

The approach that I would prefer is as follows (and this is just a first cut):

1) The audio output of a conventional CW receiver is further filtered by a DSP filter with narrow bandwidth and phase linearity (zero group delay). This filter is at 500 Hz and has an adjustable bandwidth down to, say as little as 20 Hz or so.

2) The output of this filter is clocked into a CCD (charge coupled device) or "bucket brigade" with 100 taps (10 taps per bit). The clock rate can be initially set and synchronized manually by the operator, but

the subsequent clock synchronization can be maintained by using the kind of "early/late" synch methods that are used in spread spectrum. The clock should have an "inertia" property that prevents rapid fluctuations. These methods are used in many applications. A follow-on project could be the fully automatic lock-up and synch process (not necessary for starters).

3) A threshold detector distinguishes between ON and OFF. This can be set manually or it can be determined "on-the-fly" by the software, possibly using a preamble of 10 dots. An initial up-front manual adjustment would get things started.

4) Each set of ten taps corresponds to a dot length. Each set is converted to positive-going voltages, and then put through an integrate and dump filter.

5) The collection of ten outputs from the ten integrate and dump filters is then compared with the threshold and 1/0 levels are sent out for processing into text.

6) One important aspect is that 3 contiguous ON states at the outputs of the integrate and dump filters are combined to form a dash or 3 space symbol. This combining is equivalent to an additional filtering process. A method somewhat similar to this is the "Welch method", used in DSP work (Oppenheim and Schafer, 1975).

7) An alternate (possibly better) method would use *parallel* bucket brigades that are set up for A) dot plus space, B) dash plus space, C) 3 spaces and D) 5 space intervals. The exercise is then to process these with some kind of "decision making" software algorithm.

8) The processing could be done with a stand-alone gadget that uses an LCD readout plus a printout capability, or a PC interconnect. For starters, the PC approach would be better.

The final result would be a greatly enhanced capability for Morse code CW that would allow a solid interface with both computerized communication and the human operator who knows how to operate CW. This

end result would be a *compromise* between the relatively inefficient Morse ON/OFF system and the other more efficient but more specialized data methods that demand data processing for the human operator.

One powerful tool that CW operators use is the fast QSK break-in mode. This should most definitely be part of the approach, for it allows error correction. This can be manually operated at first, but later on automated. We don't have to do the whole ball of wax at one time, it can be spread out.

I believe this would be a uniquely valuable enhancement of the Amateur Radio Service for this one special reason: the number one thing about CW is that the Morse code can be read mentally or written without any machine intervention, and for Amateur Radio in particular this is powerful. The enhancement in noise and interference adds additional power.

Yep, this it true, the sidband sounds bad because the local
ocillator in the receiver is free running, and not in phase
with the orignal transmitting phase. Under demodulation, this
phase difference gives the donald duck sound. If the transmitting
station would transmit a small pilot carrier, and the reciever
used a synchronous detector it would clear up this problem.

Source record: 89704

My HEATH IB-101 Freq Counter (built in 1970) has 3 of 5 buffer-storage ICs
that are fried. The other 2 work fine and output good signals to the readout
when interchanged with the fried ICs. I'm unable to locate a source for
replacement parts and would very much appreciate any suggestions. (I know,
the trash bin is an option but, please, last resort only!)

Heath part number is 443-29. No help, not listed in NTE or SK catalogs. IC
was made for Heath by Fairchild Semiconductor. Think both are out of this
business now. Generic or Manufacturer's part number off parts list in manual
is CuL995979. Also not listed in NTE or SK catalogs. Also not listed in
Fairchild section of Gerber Elect Catalog dated 1987. Only markings on IC are
"F" Fairchild logo, Heath p/n 443-29 and date code 7036.

IC is 16 pin DIP. IC contains 4 flip-flops and a gate. Pin 16 is Vcc, 15 thru
10 are input/outputs, 9 = no connection, 8 = gnd, 7 thru 2 input/outputs and
1 is gate.

Anyone know of possible parts sources? Or cross-reference to another part
number (hopefully to something available now)?

Anyone out there have a junk chassis with these ICs intact? The Heath
IB-1100, IB-1101 and IB-1103 are bigger versions of this Frequency Counter
family with more functions/options and would likely have the same
buffer/storage ICs.

Would love to get this baby running again. It is amazingly accurate in the
audio and low frequency ranges.

Again, thanks for the read & best wishes.

Carl
I stated on another thread that, although I am a strong advocate of the preservation of Morse Code, I can see no technical justification for keeping it as an amateur requirement. I know that more than a few third world countries have no better. Also, it is an ITU requirement which is to be revisited. These are polico-socio-economic issues.

Likewise, I believe that arguing that Morse is obsolete is not valid because use of HF is obsolete.

If I had a vote, I would recommend that the existing digital bands be subdivided with Morse and other digital. If the preservation of spectrum argument had any validity, I would say 10% would be adequate.

Listening to the bands, I can say that a more realistic figure would be the bottom 20 kHz (or less) of each HF band. I believe that use of these bands probably should have a code test. I have no feeling on the grades. I think the code should be an endorsement. I think 5 wpm is adequate to allow use. I think conditions and competition on the bands would force a faster code speed.

-> NNTP-Posting-Host: 222.229.249.54
->
-> > Does anyboby know of a method to determine which winding is bad on
-> a > transformer?
->
-> Uhh, typically we use an ohmmeter.
->
-> You should see essentially infinite resistance to ground from
-> all terminals on the transformer (unless a ground tap is provided), a
-> series resistance on the primary that is consistent with its
-> power rating (a few ohms, typically), and infinite resistance
-> between any primary and any secondary terminal.

For a high-voltage winding, you may want to borrow a megger; insulation that tests good with only a couple of volts from your multimeter may break down under, say, plate voltage. Its an excellent check to do at a flea market, though, as you decide if its worth lugging all that iron home.

->
-> If you're lucky, the primary is the inside winding. Disassemble the
-> core laminations, discard the secondary, and wrap about 20 turns of
-> #18 stranded insulated wire on the primary. Reassemble (not
-> COMPLETELY) and apply primary voltage. This will give an approximate
-> turns/volt rating for the secondary. Now calculate how many turns

It's useful to remember the fundamental equation for transformers, which is V=4.44*f*n*A*B, where V is total volts, f is frequency in cycles/second, n is number of turns, A is the area ( L*W) of the core in square units (inches or metres), and B is the flux density of the core( in webers per square inche or square metre) - many small transformers in my experience have a flux density set around 1 weber/square metre, so it is a good place to start.

When re-winding, it's a good idea to aim for a few percent higher no-load voltage than what you'll need under load - there will be a drop due to the leakage reactance of the transformer, and the resistance of the wires.

-> you need for your desired voltage, and the largest size wire you can
-> use.

The ARRL handbook has some guidelines for wire size - Table 11 of Chapter 35 of my 1991 edition says 700 circular mils per amp is a rule-of-thumb for small transformers. You can get the area by squaring the diameter in thousandths of an inche; so a #12 AWG wire is 80.8 mils diameter, 6530 circular mils area, and would be good for about 9.3 amps. Duty cycle, ambient temperature, and cooling all make a difference.

"Reference Data for Radio Engineers, 5th Edition" has a chapter on designing small power transformers...don't know if this is in the newer editions.

(Hmm...a typical ham shack has a Cantenna around...I wonder if anyone has tried out sinking his plate transformer in a can of transformer oil? Probably the mess and inconvenience aren't worth the extra rating you could then get from the TX.)

-> I've successfully rewound lo-volt secondaries with
-> paralleled windings made from discarded 12 ga insulated electrical
-> wire. If you have the bucks, there is a square enameled wire made
-> specifically for motor and transformer winding, in sizes up to
-> 8/0, I believe (like 5000 amp service).
->
Legend has it that your friendly local motor rewind shops are good sources of small amounts of magnet wire; they have tag-ends of spools which will be too short for a motor rewind. I haven't tried this source myself but it's worth investigating.

-> Have fun!
->
-> N6OTQ

Indeed. I was quite proud of the first small transformer I rewound from a 24 V CT winding to two 18 V CT windings for a dual-voltage power supply - even if it did buzz a bit (never did get all the laminations down tight).

Re-winding transformers is a good way to re-assure yourself that the math really does work.

## 3878. **Comparison: Ramsey SR-1 vs. Homebrew SW**

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-22 00:00:00 UTC
From: tonyz@rose.hp.com
Message-ID: <62lo4f$amd$1@rosenews.rose.hp.com>
Source record: 89708

Hello there.

I had earlier posted an article regarding the Ramsey SR-1
shortwave kit.

I had started compiling projects I was interested in using
active mixers and many different unique schemes for ham and
shortwave receivers.

Not having any prior experience with NE602/612 mixers, I
thought it would be interesting to see how the Ramsey kit
performed to give me an idea of the performance simple
direct conversion and superhet circuits I should expect.

After completing the SR-1, I found the sensivitity to
be good, selectivity to be lousy and the stability....
well, let's just say there is no stability. I thought
perhaps I had a bad component, but after much surgery
found the NE602 and the rest of the rf deck to be
fine. I got some great feedback from others who have
built this unit and this is the expected performance
for the SR-1. This unit uses Varactor tuning and I
think one person remarked that they may have stretched
the capabilities of the MVAM108 varactor a bit which
is contributing to the instability.

The SR-1 is a 'superhet' but does it in a way in which
the local oscillator sweeps across a front-end bandpass
of about 2.5 MHz. You can select any 2.5 MHz portion
of 4 to 10 MHz. The IF is 260 Khz, and you'll hear
the same station at the local osc +/-260 Khz which
is annoying. The local osc circuit which is part
of the NE602 appears to 'pull' when listening to
a strong broadcast station which is extrememly annoying,
and the stability really SUCKS! as evidenced by any
off it later.

What I did then was build a receiver using an NE612
and used a idea I found in an article in a magazine
from the early 90's that used two MV209 varactors in
a superhet configuration so that the local oscillator
tracks the front end with an IF of 455 Khz. I got
hold of a Toko ceramic filter to hang of the output
of the NE612 and changed some inductance values a bit
so I could lurk around about the 9 MHz shortwave band.
The usual LM386 completed the audio circuit. Used a

couple of 2N3904 BJT's in an RF amp config to get
the ceramic filter output to a germanium diode AM
detector. Found an AGC circuit and put that in,
I still want to add an S-meter and BFO but I haven't
gotten the BFO to oscillate yet. The difference
in performance in incredible. I have great sensitivity
with about 50 feet of wire, great selectivity between
the SW broadcast stations and it is VERY stable with
the addition of NP0 caps for the oscillator section.

I now have a nice little radio that is about 100 times
better than the Ramsey kit.

I guess the bottom line is, if you don't have the capability,
tools and instruments to design and build your own simple
superhet, the Ramsey will do....especially since beginners
don't ..so the kit does have some redeeming value. Maybe some
kid will decide this stuff is very interesting indeed and
go on to better things.

It certainly was interesting comparing the different
superhet schemes and the resulting difference in performance.

My next project is going to be another Shortwave receiver
using other types of active mixers, possibly mosfets etc..
and expanded band coverage... but first I have to get that
BFO working!!!!

See ya,
Your pal Tony

I understand that you *prefer* Morse ... however, I didn't ask you
about your emotional or recreational preferences, I asked you a technical
question about the relative performance and spectral efficiency of Morse
vs. modern methods.

I was not my intention to be insulting to Slovenia o Slovenians in any
way ... I certainly hope you didn't take it that way ... my intent was
to try to prod some of the backward, stagnant majority of American hams
into actually learning something and breaking out of the dark ages ...

> And our S53MV was bored in

Don't expect *real* support for new technology from the ARRL ... they
are too busy keeping things in the dark ages and trying to suppress the
"rebel no-code-test movement" ... 3/4 of US hams are not members and the
newcomers are "not joining en masse" ... soon the ARRL be unable to keep
up the farce that it is a progressive organization that "represents US
hams."

They cost $6.32 from the manufacturer in large quantities, according
to the BOM list I have. I have no idea what a fair retail or street
price is, but $30 seems OK in one piece.

If the resistor is not ceramic or glazed, it go bad over time as oil
slowly soaks into it. All resistors are not suitable for use in
oil...beware!

A one foot long resistor is not suitable for VHF or even ten meters
unless you enclose it in a metal tube or trough, that has a
characteristic Zo close to the value of the resistor at the point
opposite the resistor. Think of the resistor as the center conductor,
and the trough as an outer shield.

IDEALLY at the feedpoint end, the Zo should be 50 ohms. At the
center, 25 ohms, and the ground end, zero ohms. Of couse you can fudge
a bit if you don't want to use it at VHF, especially since most of
these long resistors go to heck fast anyway above 100 MHz no matter
what kind of enclosure they are in.

The calatlog says the rated dissipation (steady state) is about 11
watts per cubic inch of resistor area. A six inch long and 1.62 inch
diameter resistor in air is rated at 1000 watts for two minutes, 500
watts for seven minutes, and 100 watts continuous.

> During high QRM and QSB conditions on 40m and attempting to do HF packet,

Enough said (when you said "HF packet" and PK-232 ... the HF packet
mode is NOT, repeat NOT, "a modern digital mode." It is over a decade
old, NEVER worked worth a damn, and was a half-assed abortion when it
was new ... and I believe it's creators know that at the time, but
thought it expedient to "get something on the air to generate interest
in digital modes" ... I believe that was a bad decision that has come
back to haunt amateur digital operations in general because so many
people have gotten such a bad taste in their mouths from the astoundingly
BAD performance of AX.25 packet on HF channels.

> I must say though that I think AMTOR and Pactor are great digital
> modes.

AMTOR is better than packet for the HF channel, Pactor is even better.
Newer modes such as Clover, Pactor II, are better yet. And future modes
yet to be developed and fielded will doubtless be even better. However
OOK Morse will always be stuck with the same disadvantages.

> In this case though, Packet was useless.

"Standard" packet, on HF, has ALWAYS been virtually useless.

Care to explain the "2000 packet system??? Last I saw, you could get a
PK232 for a couple of hundred bucks on the used market. You can't charge
$1800 for the radio and computer against "packet operation" ... I'm sure
that you use both for other things.

> Well, I am thinking of Amateur Radio applications. For starters, Amateur
Radio
> is a form of two way communications designed for the transfer of information
> from one Ham to another.

That is true ...

> It was not intended for the upload and download of
> 10Megabyte zip files, that is what the Web and internet are for.

Where in Part 97 does it say that??? Is it really your contention that
ham radio is supposed to be limited to contacts of a purely trivial and
useless nature, such as "cookie-cutter" DX and contest exchanges???

Besides, I have repeatedly made the point (which pro-coders seem
to be completely unable to fathom) that by transmitting data in
short bursts using efficient modulation and coding techniques, it
is practical for large numbers of operators to "timeshare" the
same "channel" ... increasing our efficiency in use of spectrum should
be one of our top priorities and OOK Morse is clearly not the best
way to do that.

> Lets step back from todays world

THERE's the major problem with ham radio today ... too many hams insist
on "stepping back from today's world" ... in other words, they ignore
reality and seem to long for days gone by, resisting progress at every
step of the way ... there's a name for folks who do that ... Luddites.

> take a step back and think about what
> information about another ham you are interested in. QTH, RIG, NAME,
ANTENNA,
> WX, OCCUPATION, etc. I am willing to bet that for nearly 70 % of all Ham
> QSOs, this is the primary concern.

That in itself would indicate that our spectrum is largely wasted ... while
it's certainly OK to get to know someone and just have a chat, there is FAR
more to ham radio that goes FAR beyond the perfunctory "cookie-cutter"
exchange ... all of the *intelligent* hams that I know find such contacts
a boring waste of time ... they'll "rag-chew" on technical topics and other
subjects of some substance, all right, but just to do the "QTH, RIG, NAME,
ANTENNA, WX, OCCUPATION, etc." thing isn't worth their time or the electricity.

> Does it really matter if it takes 5
> minutes, to say "QTH IS BOZEMAN, MT" or .005ms?

Sure it does ... if I can say it on just 1 second, that means that
for the other 4 minutes and 59 seconds that you're wasting the spectrum
on your channel with OOK Morse, many others can be using the channel
that I used because I used mine EFFICIENTLY and you didn't.

> The beauty behind this hobby
> is to sit down and take time to relax and "Chew The Rag" with others who
share
> the same interest. Why does eveything have to revolve around speed?

It revolves around efficient use of spectrum ... all around us all of the
other radio services (except broadcasters, perhaps) are using more and more
spectrally efficient techniques to respond to the huge increase in demand
for spectrum and services ... if we continue to grossly underutilize our
bands, we make a FAR better target for requests that our bands be reallocated
to better uses ... "Hey, those hams are still back in the dark ages, with
Morse code, while we're using (fill in the name of a much more modern, more
efficient technology here) and still need more spectrum to meet demand. How's
about you guys (referring to the FCC) blow them off and give us those bands?
WE will make much more efficient use for them and serve the public far more
than a few old coots using Morse code."

> A message sent via the NTS contains only a 25 word body with a header and

First, let's admit that the NTS is a freaking dinosaur that serves no real
purpose other than to entertain those who choose to participate.

With that out of the way, yes, it does matter, for the reasons I've outlined
above.

> >> I
> >> agree that at VHF, CW is probably inefficient, but there is still no

> refering to information/bandwidth.

The point that you are missing here is that you are comparing a mode "standard
HF packet," a-la the TNC2 and clones, which I readily admit SUCKS BIG-TIME.
Anyone who claims differently clearly is not in touch with reality.

However, it is easy (and cheap) to implement FAR BETTER modes which can handle those static crashes, selective fading, and QRM. Clover and Pactor II are two modes which are available as "off-the-shelf, plug-and-play" hardware/software. More (and even better) modes will become available.

It's time to recognize that we simply can't afford the luxury of remaining nostalgically in the stone age "just for fun." Besides, many don't find OOK Morse "fun" anyway ... I personally find it boring as hell and haven't felt a single urge to use it in many years (I'm not sure WHY I would feel such an urge, either ... perhaps a masochistic moment???)

> >> pounding brass is the spirit of Amateur radio,
> >
> >That is little more than dogma.

> This is what seperates the Amateur Radio world from that on 11m.

NO, that would be the fact that Amateur Radio is *supposed* to be primarily a technical/experimental service with public service aspects. CBers aren't/weren't permitted to legally tinker or build their rigs, or even to adjust them, unless the CBer held a Commercial Radio Telephone license of 1st or 2nd class. It has always been the technical side of things that has separated hams from CBers. As a "lid filter," Morse has failed MISERABLY ... just listen to the horse's asses on 75m and 20m and you should be able to see that ... they are ALL code-tested.

> >> where a HAM is judged on how accurate and precise his fist is

Pardon me, but "character, my ass" ... As a "lid filter," Morse has failed and continues to fail MISERABLY ... just listen to the horse's asses on 75m and 20m and you should be able to see that ... they are ALL code-tested.

Besides, FCC licensing should NOT be intended as some sort of "personality filter" or even a "test of one's dedication to the protestant work-ethic." The spectrum belongs to ALL of the public and the FCC only administers it for the public good. While it is necessary to test for sufficient technical

knowledge and knowledge of rules and regulations to prevent safety hazards and to assure that the applicant at least knows the rules and limits (nothing can, a priori, guarantee compliance or "good behavior"), that is really the limit of what are justifiable barriers to entry and participation. Having skill in OOK Morse does not contribute 10-cent's worth of value to the process any more ... at one point, it was necessary, but today it has long since outlived any utility it used to have. (the testing, that is, you are certainly free to use the mode for recreational purposes, if you wish).

> that Bringing amateur Radio into the twenty first century means getting rid
of
> CW.

That is NOT what I've said ... none of us (except the occasional pro-code radical who tosses out a red herring) is talking about "getting rid of Morse." None of us have proposed, in fact virtually everyone has said they would not support, any move to ban Morse usage or reduce the amount of spectrum available to Morse usage in any way ... in fact, many of us support the establishment of small (say 25 kHz) Morse ONLY sub-bands at the bottom of the HF bands, where none now exist (the only Morse ONLY sub-bands are at 6m and 2m, where Morse testing is not required, which shows how "important" Morse testing actually is (not))

> That is the foundation that this hoby was built on. It would be like

But nobody *forces* you to sit back and reflect on that on the 4th of July or any other day.

> A tree
> growing larger and larger, without holding on to your roots, more than often
> leads to a tree that is lying on the ground dead.

And if the tree doesn't branch out and spread its roots, it will also die.
Trees don't rely on a *single* root, they put out many.

> If we get rid of the code
> requirements in Amateur Radio, soon we will get rid of the licensing
> requirements, then what have you got?

That is absurd ... as pointed out above, there will ALWAYS be a requirement for testing on theory and rules/regs ... many of us feel that the theory tests could be improved a great deal. We are NOT "trying to turn ham radio into another CB" as many pro-code radicals keep insisting. That is just FUD (Fear, Uncertainty, and Doubt) tactics ... another red herring. Don't buy into that garbage, please.

> There was a time when people had to
> get a license to operate a CB radio.

Right, but all you had to do was fill in your name, address, etc. on the form, sign it, and mail it in. There NEVER was ANY sort of *test*.

> They threw that out and what happened to it?

The FCC lost control of 11m long before they discarded licensing for CB ... licensing never had a thing to do with it.

> Do you honestly want to see the Ham Bands turn into that

Of course not ... but I don't want to see ham radio die completely, either, and that WILL happen if we don't make big strides in catching up with the rest of the world ... we USED to lead in radio technology, now we're (over all) at least 20-30 years behind.

> (although
> listing to some of the conversations on 3950kHz, I sometimes wonder if it
> hasn't happened already). CW is one of the founding roots separating us from
> the CB world, lets keep it that way.

Read what you just said about the "decline" ... those are ALL code-tested operators. Code hasn't kept them out ... but it has discouraged many who could have contributed GREATLY ... I've worked with hundreds over the past 25 years in the RF industry who would have made great hams and could have done a lot for the service ... but found ham radio so backward and cranky that they decided to spend their time in other technical hobbies like computers,
radio-controlled planes, etc.

Please consider my points with an open mind ... I realize that the code is "tradition" ... but in this case a change is LONG overdue if we are to survive in the long-term.

What kind of modification are looking into. The plate supply is
derived from a 3300 VAC CT secondary into a mercury vapor full wave
center tap rectifier. The choke is in the center tap lead to ground
to eliminate the need for high voltage insultaion of the core. The
choke should measure about 60 Ohms. If you need a new transformer,
Peter W Dahl makes a replacement for it.

From the Oak archives you can obtain MIMP. Motorola Impedance Match
program. It runs on DOS, but is a good tool to match transistors with
known impedances. Works very well and aloows many types of matching
components and arrangements. The third screen is a Smith Chart and
you can move the elements around onthe chart. I have used it and have
had good results.

# 3885. Re: Heath IB-101 Freq Counter help needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-23 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.971023000740.9435A-100000@Ocean.CAM.ORG>
Source record: 89715

It's nice to see such detail when asking for a subsitute. If more people took the time to figure out some of the details, getting answers might be easier.

My first guess, automatically since it was common back then, was the 7475. But that can't be, because the pinouts are not right.

I did some looking, and that part number doesn't show up in an HEP replacement guide from about 1974. For what it's worth, it doesn't show up in a Radio Shack replacement guide, but I was't really expecting that.

I couldn't find other 4-bit latches besides 7475's and 74175's in the old data books that I have, though there is one or two that I can't get to easily.

I'm fairly certain it's a ttl part, and I'm quite certain it is not CMOS. It is too early (I have a review in front of me for it, in the April 1971 issue of Popular Electronics) for CMOS to be in common use.

The 74175 does seem like a good guess. From the GIICM, here's the pinout:

74175
4-bit D flip-flop with complementary outputs and reset.

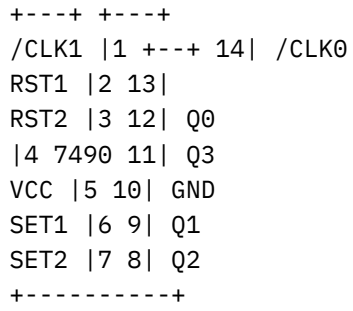
```
+---+ +---+ +----+---+---+---+---+
/RST |1 +--+ 16| VCC |/RST|CLK| D I Q |/Q |
Q1 |2 15| Q4 +====+===+===+===+===+
/Q1 |3 14| /Q4 | 0 | X | X I 0 | 1 |
D1 |4 74 13| D4 | 1 | / | 0 I 0 | 1 |
D2 |5 175 12| D3 | 1 | / | 1 I 1 | 0 |
/Q2 |6 11| /Q3 | 1 |!/ | X I - | - |
Q2 |7 10| Q3 +----+---+---+---+---+
GND |8 9| CLK
+----------+
```

What doesn't seem to fit is your comments about pins 1 and 9. Is that information from the "How it works" section, which perhaps is in error, or the schematic itself?

I would guess that the digit counters were 7490's (though nothing I can put my hands on gives such detail), because they were common. Looking at the picture in the review, it does look like the counter is a 14 pin device, like the 7490.

7490
4-bit asynchronous decade counter with /2 and /5 sections, set(9) and

reset.



That might help you see if the 74175 is a match, remembering that the bits from the 7490 might not go to the pins with the same label, since it doesn't matter and board layout might be a concern.

Most sweep tubes that I have always used in my Drake fail to last
more than 2 or three years. I converted the 6JB6's in my T4XB and
have had them in there for more than 2 years and no loss in power out.

>circuit diagram to the xtal manufacturer when ordering xtals

Yes it is wise to send a copy of theschematic to the vendor. This
will tell him what kind of oscillator circuit is being used. If I
remember correctly a Pierce oscillator requires the crystal to be in
series resonance mode. All others require anti-resonce mode,
parallel, and require a load capacitance.
>72
>---
>remove the "spam" : Jan-Martin N&#65533;ding,LA8AK@online.no
>
>

A crystal operates between two frequencies. Series resonance and
parallel resonance or anti resonance. The frequency determined is
dependant on the load capacitance and cut of the blank istself. A
specified crystal may or may not need a load capacitance. That will
depend mostly on the type of oscillator being designed. The load
capacitance is the circuit capacitance at which the desired frequency
is obtained. Frequency pulling or warpping is done by deviating from
the desired load capacitance. This can be done by introducing a
reactance in series or parallel to the crystal to move it from a set
frequency. Fundamental crystals, ie operation on their fundamental
mode, are usally below 20 to 30 MHz. Overtone crystals wil operate
at odd multiples of the fundamental frequency, ie 3rd, 5th, 7th
overtones.

Yep, and specifically, that can cause the core to go into saturation.
Someone once tried to tell me that if the core on a transformer doesn't
saturate with no load on the secondary (power applied to primary),
putting a secondary load on it will only decrease the core flux and
take it further from saturation. I believe that is correct, but only
for loads which are balanced (no DC). I promptly did a test, and
sure enough, it was easy to saturate the core with a half-wave
rectifier load. Generally high on the list of bad things to do to
big power transformers. (Note: this can happen if one diode of your
full wave rectifier (either center-tapped or bridge) opens. It may
be fortunate that usually solid state diodes short and make the problem
obvious, though I have seen them open too.)

I have seen lots of usefull atricles and circuits referencing
the Radio Society of Great Britian (RSGB) manual. I would
like to purchase one.

The catch is that I live in Toronto,Ontario,Canada. Does anyone
know of a local place ( <= 500 miles) that I can order one, or do
I have to order one from over the pond?

Cheers, Gabe. (hope it is lighter than the ARRL manual)

Isn't the Pierce, the circuit having an xtal between screen and
control grid.....
it is 180 degree phase shift between the ends of xtal and it must be
parallell ressonnance. If a series res. xtals works better for
something nearer to the correct frequency it is perhaps because of
incorrect specified parallell loading capacity?
What is loading capacity for 27MHz xtals? I have used them on 5th
overtone (for 2m RX applications) and- even on 9th overtone on 81MHz

Source record: 89726

Brigar Electronics 607-723-3111 has a power transformer which
delivers 16 volts at 25 amps. Part number DL-16-25 for $49.95.

Another transformer is 12volts at 24 amps. #DL-24-12 for $25.95.

The first transformer will be closer to your goal, although,
the unfiltered no-load voltage is higher. I am assuming
that you are building a linear power supply, classic textbook.

Be sure to provide enough power transistors (ie 3771, 3772),
heat sink, and a cooling fan.

73, and good luck.

>. . .

I don't know the particular layout of this rig, but I've found that a common problem in direct conversion receivers is AF feedback due to audio ground current from the 386 getting into the first audio stage. One thing that really helps is to take all mixer ground pins and connect them together and directly to the "ground" side of the audio amplifier input. Then connect the combination to ground (ground trace or ground plane) only at one point. The "ground" side of the audio amplifier input would be, for example, the ground side of the bypass capacitor for the second (non-driven) side of a differential audio amplifier. Or if the first audio amplifier is a common-emitter transistor amplifier, the correct point would be the ground side of the emitter bypass capacitor; if a common-base stage, the ground side of the base bypass capacitor.

# 3901. NTS in the 21st century? Re: Morse in the 21st century

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-23 00:00:00 UTC
From: wdr@world.std.com
Message-ID: <EIIG94.38@world.std.com>
Source record: 89731
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.policy

First off, we've strayed from CCW etc, so I'm re-directing any
follow-ups on this article to the r.r.a.POLICY group.
It would be nice if the other threads, as they diverge from
homebrew issues, could find their way there too.

In article <01bcdf57$2db337c0$0100005a@wa6vse>,
Carl R. Stevenson <wa6vse@fast.net> wrote:

> First, let's admit that the NTS is a freaking dinosaur that serves no real
> purpose other than to entertain those who choose to participate.

This no-code NTS member will readily admit that the NTS being
wedded to CW as the primary long-haul (non-voice) mode is an
embarassment, but it is not purposeless. The NTS's
continued primary use of CW the result of the typical CW/morse
bigotry alone, but has recent historical reasons and an
operational rationale (which I hope we can work through).

1. Continued Purpose

NTS is the best place for new RACES and ARES operators to get
real traffic handling experience. Handling one or two
messages a month on the the RACES drill net isn't the same as
handling a flood of welfare messages -- which is nicely
"simulated" by county-fair / Jamboree traffic, which latter
really is Welfare traffic even if we don't so label it, the
kid is away from home; prioritizing the THROUGH traffic first
so it makes it to the region net isn't covered in RACES
one-way traffic, etc. Contests are also good practice, I
suppose, especially Field Day since it's in the field, but
even the Sweeps and FD exchanges are pretty trivial traffic.

2. NTS history with HF Digital

Carl's right, the "standard" HF Packet has problems.
Packet being node-to-node has other problems for NTS,
too, whether HF or UHF/VHF.

That the CW-nuts that are NTS ringleaders got burned on both
HF packet being a dud and BBS pickup being unreliable
accounts for their being leary of newer digital modes,
and is a problem that must be addressed over time.
That the CW-nuts in charge still believe the myth that CW gets
through when other modes don't, thinking that *Tor and Clover
are no more resilient/sensitive than HF Packet, ie less
tolerant of QRN/QSB than SSB, doesn't help; this again must be

addressed by education.

(Explanation of BBS problem: The software on most BBS which is fine for broadcast messages and personal messages addressed to TNC-owners doesn't have double-lock protocol to prevent double-pick-up of NTS messages addressed to general public members nor any way to trace a message that was picked up and not delivered, or to route it back up the tree for re-routing if it sits around too long awaiting pickup; there's no automatic ACKnolwedgement of resonsibility -- a protocol problem; BBS's NTS implementations doesn't implement what our local nets and personal logs already do.)

Now that more of us have battery-operable computers so that digital modes are survivable for use with RACES/ARES comms, the operational objections should be disappearing. There is a digital backbone for NTS in parallel to the TCC CW net; check QST's box-scores and you'll see them listed, but you may have to read the PSCM to decode it. At least around here, they prefer to have traffic routed Voice or CW after it arrives on via HF Digital and takes one UHF/VHF packet hop to the clearing house, since otherwise it gets lost.

Upgrading all the BBSs to have automatic tracing of packet would be logistically hard (too many suppliers, not all nodes upgrade routinely, etc), so I can understand why no one has done it. But that is what it would take to make automated end-to-end digital NTS real. If I ever get a non-programming job, maybe I'll take on writing an NTS-only BBS or an NTS-add-on for a popular BBS -- but that's likely not this decade.

The RSGB manuals are very expensive, last check for the
microwave manuals at about $70.00 CDN. The ARRL
books are a far better value.

Not only that, you can communicate with the large number who do have TNCs for one reason or another.

It makes good common sense to me. The more advanced modes are worth exploring also and should be, at the discretion of each individual. There are plenty of opportunities and plenty of room for all points of view.

The things that makes no common sense at all are the big "pissing contest", the "do-it-my-way-or-you're-stupid" and the adolescent bullying that are going on.

And after giving it a lot of thought and reading I am sure that Morse code reception in a weak signal and interference environment can be, and should be, greatly improved without the more stringent Coherent CW (CCW), especially with the personal computing capabilities that are easy to own these days.

I don't know about that; the RSGB books seem to be written for a more technical audience (certainly a more numerate audience) and often go into detail that the ARRL books omit. Now, I'm not dumping on the ARRL; their stuff is very practical and useful. But the GSGB puts more emphasis on theory, and there's a place for that too. I buy from both organizations and consider them complementary.

Depends on where you buy them. I bought the previous issue of the
VHF/UHF manual from a local ham store for about $70. But I think
Norham sells it for $40. That's in the same price range as the
ARRL publications.

Also, the RSGB books seem to include a lot more detail than the
ARRL ones, and they assume that the reader knows more.

I find that there is often a large gap between where the information
in the ARRL publications end and university-level textbooks begin.
The RSGB books fall nicely into that gap.

You could get around part of the timing issue by using an automatic shutoff charger. You could use the timer to turn it on when you're not using the system, thereby avoiding any RF interference. Or, you could just simply turn it on when you leave, off when you come back. A good automatic charger should shut off or go into a super low current trickle charge that can be left on indefinitely.

If those lamps are incandescents, they pull a lot more than 1.25 amps when they first turn on...Like 10 or 20 amps till they get appreciably bright. Heat sink those little hummers and expect to replace the 4 amp SCR's on a regular basis.

Jeff,

While SCRs are switches, they have resistance. Pass a current through a resistance and you get heat.

You should heatsink your SCRs, especially when running them near (or at) full rated current ... otherwise you'll be replacing them soon. If your SCRs have insulated cases (some of the TO-220 packages are isolated, some are not) you can use a common heatsink without worrying about insulators.

Good luck,

Rick

# 3919. Re: RSGB manual for Canucks

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-24 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.971024000758.3076A-100000@Ocean.CAM.ORG>
Source record: 89749
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc

I have the RGB VHF manual and "Amateur Radio Techniques" (do new editions of that ever come out?) from about twenty years ago. I've always enjoyed them, and still find them useful. They were different from the ARRL books, beyond the fact that they included tubes after the ARRL books used them only for transmitting. It is good to see things from a different slant.

I have a fifth edition of the RSGB manual. I think I got it less than a decade ago, though from the copyright page it came out in 1982 and would seem to be a more compact version of the issue that came out in two volumes around 1977. This one does have a reprint date of 1986.

It too gives things from a differnt view from the American ham magazines and the ARRL books, and it included tube projects. When someone here recently in rec.radio.amateur.homebrew mentioned G3PDM's advanced hybrid receiver, I was able to go to my RSGB manual and look it up. And yes, it is different from what was being described at the time in the American magazines, and probably some things can be learned from it today.

Whenever I got this RSGB Handbook, it carries a price sticker of $40.34. Expensive, but ARRL books have gotten expensive (especially by the time they land in Canada; I keep putting off buying Wes Hayward's book on RF design).

I got it at an electronic store here in Montreal, North American Electronics. Sadly, when I was past there a few months ago, I discovered that they had closed.

They carried ARRL publications, and I somehow thought they got the RSGB books along with ARRL books.

I don't know where you can get RSGB publications in Canada. There's a hamfest here on Saturday, and I'll keep an eye out. I do note that the RAC website makes no mention of RSGB books (or ARRL publications for that matter), so I guess they only distribute there own.

They do have a list of amateur radio stores in Canada where you can get RAC publications. It's at:
http://www.rac.ca/books.htm
Just scroll down and you'll find the list. Maybe going through the list, including quite a few in Toronto and Ottawa, you can find some store that sells the RSGB books. I couldn't think of any other list of Canadian ham equipment distrubutors, though there must be one somewhere.

Hope this helps.

A tripler is simply a class C stage with an output tuned circuit at 3 times
the input frequency. There can be an input tuned circuit, tuned to the
input frequency <duh>, if you need it for impedance matching purposes,
too. In this case you don't. Any decent RF transistor capable of a few
milliwatts at VHF will work here. Typical circuits are in the Handbook.
This *isn't hard*, in fact it is harder to try to *not* get third harmonic
output from an amp than it is to make a tripler work.

The tuned circuit in the tripler collector circuit does the cleanup *before*
you hit the brick. You don't want to drive the brick with out of band
signals. Nasty.

>that should be a temporary matter).

Well, you can certainly build them for less than what Kanga gets for the
kits. The only real advantage of buying the kits is that you have everything
in one bag and don't have to scrounge, or make your own PC board. But if
you want cheap, then you *can* scrounge. The most expensive parts are the
mixers, and you can get them for $4.95 each (maybe cheaper at a hamfest).
The rest of the parts are nickel and dime items. And you don't *have* to have
the PC board, you can build it dead bug style on a piece of plain copper clad.
I build a lot of prototype stuff this way, it is quick and cheap. Just follow
the QST (or Handbook) construction articles. You don't have to *design*
anything, just lay it out and wire it up.

>And that's what makes it not a 'reproducible project' for me. These are
>all fine ideas, but that's the key point being missed here.

Use a crystal oscillator. It doesn't get simpler, or cleaner, than that. If you are afraid to tackle building a crystal oscillator from scratch, International Crystal has a little kit. But this really is a no-brainer. If you can't get a crystal oscillator to work, then you aren't up to building RF gear.

>without a non-FM 2 meter transmitter). Maybe a 6 meter SSB receiver is
>the place to start, but where's a reproducible project for that?

As I noted, just follow the Motorola appnote for the MC2833 except use a crystal for 50.xx instead of 49.xx and you *have* your low power 6m FM transmitter. Ditto with the MC13135 receiver chip. Add a power amp as desired. If you don't want FM, then the R2 and T2 are the best homebrew route for *any* of the HF/VHF bands (and 70cm too).

Of course you *do* have the alternative of converting a SSB CB to 6m. That's fairly easy to do with most of them since they use high side injection. Just prune the RF input and output tuned circuits. The hardest part of the conversion is futzing with the synthesizer to get it to tune where you want. That can be a pain, which is why I recomend crystal control (perhaps VXO) for your first attempt at homebrew.

Since you can often get a CB for free (or very cheap at a yard sale), these make fine *IF strips* for your projects, whatever the band they wind up on. Just toss the synthesizer and PA circuits and use the basic rig as a SSB/CW IF/AF strip for your project. This eliminates a lot of low level construction, and saves some bucks too. They all use a more or less standard filter SSB design. It will likely be as good as anything you can build from a kit (except the R2/T2) and should cost under $20.

GREAT SOUTH BAY AMATEUR RADIO CLUB

LONG ISLAND HAMFEST-COMPUTER SHOW - OCTOBER 26, 1997

LINDENHURST, LI - NY

On October 26, 1997 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the Knights of Columbus Hall located at 400 South Broadway, Lindenhurst, NY.

ARRL Approved.

There will be radio equipment, electronic componets, computers and access-ories, softeware, books, technical manulas, ARRL information, Amateur Radio License Exams and information. General admission is $ 6.00. $5.00 with coupon. (coupons available at the door)

For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam seesion. 1996 ARRL/VEC fee is $ 6.25,
exact change is appreciated. Novice exams are free.

The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.
For vendor and additional information pleas contact, Walter Wenzel KA2RGI at (516)957-0218, or Tom Carrubba KA2D at (516)422-9594 during EVENING HOURS ONLY (7PM-10PM). NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the limited space available. Tables are 2.5ft x 6ft.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL and 223.86 OC. Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:
Great South Bay ARC
P.O. Box 1356

I collect early microcomputers. I would like to own an
Apple 1 motherboard. They are difficult to find and I am
willing to pay good for one. If you have one and might be willing
to sell it, please email me. I have a very
nice Altair 8800 that I can throw into the deal if you are interested
in getting one of those.

Thanks,

BOB

China Ham News 10/25/97
China on EME!

BY1QH, Beijing, confirmed three 2-meter QSOs on EME on Saturday, October 18, and Sunday October 19, 1997. The Tsinghua University Amateur Radio Club station ran 200 watts into a 4x9-element Yagi antenna.

In the first EME experiment, David, BZ1BM, and Lars, SM0KAK, had hoped to work VE7BQH and W5UN from BY1QH, but failed. They did work into Europe and QSOed with three SM stations. David and Lars also heard some DL, 9K and JA amateurs on EME, and are planning their second experiment shortly.

Please direct your interest in working with China on EME to David (bzibm@wg.chnmail.com), the student president of BY1QH.

Kenneth,

When on the page to programme frequencies, enter (say) 145.5000 Mhz
but use SHIFT KEY, do not use shift on the decimal place, and fill all
the unused remander with SHIFT zero.

The software will allow out of band freqs.

145.5000 mhz looks : !$%.%))))

Duncan.

I'd recommend you take a look at the book "Oscillator Design and
Computer Simulation," by Randall Rhea. It focuses heavily on design and
analysis of relatively-simple UHF oscillator circuits.

I believe the ARRL Microwave Experimenter's Handbook has a basic
power-meter recipe. It's possible to find good power meters on the
surplus market at good prices, too.

Both of these ought to be available from www.amazon.com.

_·_· _ _·_ _ _· · ·_ ·_ ·_ _ _ _ ··_· ·_

I need your collective "elmer" counsel as I am looking for a solid HF rig
in the process of rebuilding my shack.
The only semi-modern rig with which I am familiar with is the ICOM 735.
What other ICOM, Kenwood & Yaesu rigs are similar that are in the
same $500. and lower used price range?

Key issues:
1. 160-10
2. WARC Bands
3. Better than double conversion receive.
4. General coverage ok, but not necessary - I'll get a shortwave radio!
5. RIT, Notch, Passband helpful (Though I am getting a NIR-10 to 1help
kill QRM and QRN! I needed similar help with the 735.)
6. Quick tx/rx switching for digital modes, pactor, packet, etc.
7. External 12v power supply vs internal supply - preferred, but
not absolutely necessary (I'm planning to use a deep cycle or gel
with float charger - filtered to keep out noise)
8. SSB (usb & lsb), CW (AM or DSB for 75, and FM would be nice with a
transverter for 6, 2, etc. some day)
9. A few memories, nice, but not necessary (not operator memories,
frequency memories :-) Come to think of it ... never mind!)
10. Decent shape, but need not be museum quality.

Thanks for guidance, offers, etc.!

Could it be a 9314 quad latch?

-E 1 16 Vcc
-S0 2 15 Q0
D0 3 14 -S1
D1 4 13 Q1
-S2 5 12 Q2
D2 6 11 -S1
D3 7 10 Q3
GND 8 9 -MR

It could be used as a D latch with data on the D inputs with the -S inputs held low or as a R/S latch with both the D and S inputs used. E is an active low enable.

MR is an active low master reset (not a good idea to leave it open but an open TTL input acted as a hi most of the time).

This is a sharp cut-off heptode designed for computers. It is the same
as a 5915A, but has a taller bulb. The 7036 was one of GE's 5-star line.

Well the Yaesu FT747 is nice, so is the Kenwood ts440
The 440 is a better radio than the 747, but the 747 is a piece of cake
to use..

## 3938. TUBE BUYERS----->Be Warned!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-25 00:00:00 UTC
From: blues4uw76@aol.com
Message-ID: <19971025174600.NAA10998@ladder01.news.aol.com>
Source record: 89764

I bought tubes from Kevin Harlan at EMODUS (kevin@emodus.com), and three fourths of the tubes tested BAD when I received them. No offers were made to replace the defective tubes. Do yourself a favor and buy from a reputable tube dealer, not this scammer.

## 3939. Re: TUBE BUYERS~~~~>BEWARE!

Newsgroup: rec.radio.amateur.homebrew

Pehaps this is not the appropriate newsgroup, but i am trying to design a pen-like probe that can be used to detect AC current to an outlet without having to actually plug it in. These probes are available commercially and apparently detect the 60 Hz radiation. I want to build one myself to understand the theory
better.

Hi All:
I have recently picked up some intrusion detection units made by Omni
Spectra
that run on 10.525 Ghz and they look ideal for conversion for amateur radio
links.
They came mounted to a plate that looks like it was origionally mounted to a
wall
with a small parabolic reflector.
I was curious if anyone else has experimented with these units and was able
to
determine what kind of radiation pattern is developed by the antenna.

[ snippage ]

Actually it is the correct coax for use with the venerable R-390 and R-390A
HF receivers -- connect the radio directly to a dipole, no balun needed.
The connectors are still available too.

Not real useful for a scanner I wouldnt imagine though.

Do you by any chance mean the "voltage"? I used to manufacture for the Utility Industry, such a device. A proximity detector that would detect 120 volts from about an inch 240 volts at about 3 inches and 345 KV from 8 feet. (1/2 the phase to phase wire spacing distance on 3 phase of that voltage.)

You can do it with simply a high impedance FET amplifier, >10 megohms with a small antenna on the input lead. I got a bit more complex than that, with a one-shot self test circuit and some post amplification to ring piezo buzzer and the like.

Gentlemen,
I have a question for someone who may know why I observe the following when I load up this amplifier on 160m. No matter how I load/tune this amp on 160, the grid current meter deflects negative (below zero). The amp is easy to drive and seems to have no problem with arcing, etc. Plate current acts normal. Is this phenonenon a metering problem? This makes no sense to me. Ten Tec service did not really have an answer for me. Any ideas would be appreciated.

Thanks,

George

One idea may be to change the 11.3258 mhz xtal used to produce
the 34 mhz mixer fo. In the 142gtl the same xtal is 11.1125 mhz
and the divider input codes are shifted. If you would compare the
N codes and the mixer frequencies you may be able to figure out
what the frequency of the new xtal should be.

## 3961. Homebrew frustration [was: RSGB manual for Canucks]

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-26 00:00:00 UTC
From: John Mock <kd6pag@nospam.mocha.ecofe.com>
Message-ID: <4mk9ezj0fx.fsf_-_@spinner.ecofe.com>
Source record: 89643

I think it is more a matter that the RSGB books assume the reader is
willing to expend the effort to *learn* more. Otherwise, there would
be no point in including that level of background detail.

The problem I see with ARRL publications is that they start out
very simplistically, jump over a huge area labeled "Here there be
magick", and then give us a construction project we aren't equipped
to understand on the detail level. The RSGB books seem to plod
along, connecting all the dots, so that we can actually understand
what they are telling us at every level.

Yes, indeed. That's what i'm really being frustrated with. I can even
get a decent *overview* of the theory, but there's not much help with the
practice or details of the theory.

For example, i'd like to experiment with helical resonators, but i just
can't figure out how to make one from the ARRL Handbook. Sure, i can
determine key dimensions and trade-offs, and maybe even figure out under
which circumstances i'd want to do things one way or another. But how to
get the signal in and out, what materials to use, and what factors are
critical or non-critical all seem to me to be glossed over at best.

I'm not surprised that amateurs raised on current ARRL publications
turn to being appliance operators. The important background details
are omitted which would permit them to proficiently employ electronics
in their own projects. If they don't care to slavishly duplicate one of the
construction projects, they aren't given sufficient background detail
to create their own. They are left to flounder around, trying to find
information at the appropriate level to aid them.

Yes, indeed. Most of what i've been successful with i knew before getting
my license. My copy of the ARRL Antenna Book has gotten rather dog-eared,
but i don't have much to show for it. Those things that i've gotten good
use out of have been projects described to me over the air or over coffee.
It's rather frustrating and not a very good use of time. So how does some-
one who is determined not to be an appliance operator get beyond buying
almost everything off the shelf??

Now, when i can draw on my pre-amateur experience, i'm fine. I've gotten
a copy of NEC2 in C, and written Perl front-ends and post processing for
it, and as well as some plotting software that generates WWW output. Now
i'm trying my experiments in software and finally feeling like i'm getting
somewhere with antennas. But i'm often still just trying to figure out if
my simulation is bad, if i've misunderstood what's in the Antenna Book, or
that things just don't quite work right but work well enough in practice
to make folks happy. So especially with the non-HF antennas, it seems like

you either have to slavishly duplicate or understand things pretty well to be successful.

So where are you expected to learn the 'background details'? From an elmer?? By going thru the CW hazing ritual, learning everything for HF, and finally graduating to VHF and above???

The RSGB books do have that level of detail in many cases. It is just a pity that most of the RSGB books lag communications technology by so much. Fundamentals never change, of course, but some of that same lovely attention to background detail which the RSGB books give us for older technologies would be most welcome with more modern technologies too.

So if i'm trying to take some of the new ICs and use them for amateur applications, it might not be that much help? Nor could it help me with modern construction techniques?? But i guess i can learn alot about other things like how passive components work and how to build things with older technology at least, which might be a major improvement over what i'm doing right now.

In summary, the RSGB books are well worth the money whether you are a neophyte or a practicing engineer. There is something of value for everyone in them. The editors of ARRL publications would do well to take a lesson from them.

Which one(s) should i look at if i'm interesting getting started in RF construction at 6 meters and above?

-- KD6PAG (Networking Old-Timer, RF newbie)

Try the VHF/UHF Manual. The 4th edition has several different designs
for helical resonators, for example. However, that edition is about
15 years old now, and a new edition has just been published. I eagerly
await getting my hands on a copy. Don't know what's in it yet though.

Does anyone out there have any info on a UTC 51, 51A or 51AX (if there is any difference), especially the winding tap info? I believe it to be a class B driver transformer with a 2:1 or 3:1 ratio. I am not sure of its power handling ability. I need at least 7 watts.

Secondly, does anyone have one that they will part with for reasonable cost?

I have problems with 2 Tektronix scopes.
The first is a 7704A that has a parasitic oscillation in
the horizontal amplifier.
The second is a 7904 that has a weak power supply.
It will not come up with a 7L5 spectrum analyzer plugged into
it but it will operate normally most of the time with the
usual plug-ins.
If anyone has experienced these problems and found
a solution please let me know.

You'll have a problem locating a true broadband (1.8-30MHz) HF solid state amp although you do have several options.
1) Ted Henry, henryradio@earthlink.net now offers a 28v 1200w output amp for 2150 USD.
2) Lee Martin at RF Electronics, rfelectron@aol.com offers either a ready built or kit form 1200w output unit that runs off 12v.

You did not state if you are actually after a mobile unit or base?

There are several other mobile solid state amp's such as Made From Junk, SGC, Tokyo HiPower, but these three are micky mouse QRP, around 500w out.

Lots of units that are available for the 11m band but which would require a fair amount of work to make true broadband, different grade ferite xfmr's, negative feedback loops to equalise gain, switchable low pass filters etc etc.
These units I have up to 96 x 2SC2879, around 12 to 15kw out if you can supply the current.
Tube mobiles are also available but output it relative to your bank ballance.

I currently have a Lee Martin homebrew but am working on a 5-6KW 50v FET mobile with 1.8-30MHz coverage.

Good luck, hope I've given you a few pointers.

# 3974. Help with RF Splitter/Combiner

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-27 00:00:00 UTC
From: aor@gteais.com
Message-ID: <878005542.32252@dejanews.com>
Source record: 89656
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

I am building a 2 meter amplifier using a pair of MRF-151G VHF transistors (300 watts each).

How can I combine these two amplifiers using combiners/splitters which will cover 10-150MHz? I know how to do this for single band operation. My goal is to have 600 watts on 10 meters, 6 meters, and 2 meters thru this one amp. It will be mounted on the tower, so I will not have access to it once installed.

Any thoughts, suggestions, or articles would be a big help.

73, and thanks in advance.

Looking for an ultra-simple RF VFO for a flea-power xmtr project. I thought the oscillator (Q3) section of the circuit at ...

http://www.acs.ncsu.edu/HamRadio/HF/qrp/projects/160m-xmitr.html

... might be suitable, but altho I actually found a GE-2 in my parts box, I seem to have botched the attempt to build the oscillator as a stand-alone circuit. Anyone having a circuit like this that you know from experience will actually work, or some ideas on how to build the aforementioned oscillator section as a stand-alone, I would appreciate it if you'd type it in and post it. I realize this will require a bit of effort but you'll have the satisfaction of knowing that you helped not only me but also anyone who searches the archives in future for this tidbit of info. I've spent many many hours searching the web and have been unable to find anything along these lines.

I would think a stable VFO should be the quest. Then simple.
The ARRL book 'Solid STate Design for the Radio Amateur'
deals with stable VFOs. There are practical circuits for small VFOs.

Ben,

My experiences with Mini Products is that they sell low power
devices. I have seen splitters with a 1 watt capabilities.
I am transmitting 800 watts peak.

Is there a high power section to their catalog?

Thanks for the note/reply!

That is a pretty horrible circuit. It looks like someone took a $8
Radio Shack 49 MHz walkie-talkie and scaled it to 160 meters. :-)

Plus, any GE-2 germanium transistors you have in your junkbox stand a
good chance of being too leaky to be useful -- germanium semiconductors
(especially power ones) don't age all that well.

Check out a newer edition of the ARRL Handbook or "Solid State Design
for the Radio Amateur" for some more up-to-date approaches.

Ken Linney <ken@g3uda.demon.co.uk> wrote:

> I fancy taking out a subscription to either QEX or QST. I am really
> interested more in the home construction with some theory but NOT
> interested in reviews / Contest News etc.

In which chase QEX is a better choice than QST. However, they are
in no way comparable.

Unless you're a library, QST is not a subscription, it's a
Membership. For tax purposes, they'll tell you how much of
your dues services your subscription, but you can't join as a member
and elect to not pay for QST, nor can a non-library subscribe.
It's thick, with lots of Ads and "member communications" columns and
supposedly general interest stuff (like how morse code won the war
for the good guys, and how VHF hams saved South Dakota more
recently), plus all those prospective/retrospective fillers on
contests, even though they have a separate magazine for contesters.

QEX is available for subscription to members and to non-members.
It's 32 pages of construction and how/to. Not sure about theory,
haven't seen enough issues -- but I'll be adding it to my membership
renewal invoice this year.
http://www.arrl.org/qexinfo.html

If there's nothing in QST for you, you may want to pay the higher
non-member rate for QEX; however, there is one very good reason to
subscribe to QST, even if you never read it -- you become a voting
member of the ARRL, and thus have the chance to affect what the FCC
will be told every ham wants. Since Ken'sISP is demon.co.uk,
this probably doesn't apply to him, but I recommend this to those
in W[01-9]-land. The ARRL will pay more attention to our opinions
when we vote.

Be warned non-member Airmail subscription is expensive!

> I fancy QEX but have never seen one other than some clips shown at
> ARRL's Web Site. Is it for HF only?

I've seen it intermitently at HRO and You-Do-It magazine racks, but you
probably won't see it in the tobaconnists racks even in London. It has
had microwaves and Phase-3-D "how they put it together" articles.

73 de N1VUX BPL with Tech-No-Code
Still certified code free, but not much longer? passed 3B and 4A!
QST TO ALL NO-CODERS: Subscribe to QST and let your ARRL elected officials

know you'll be voting in the next division and section elections.

Source record: 89577

In response to Paul Mateer,
Of course Morse should stay. Building QRP equipment, and
Morse, go hand in hand. Even with that, tho, the Morse issue
has never had anything to do with the usefulness of Morse as
a mode. This issue, has, will, and always have to do with
the issue of easing requirements, and making it easier for
equipment manufacturers to sell their HF lines of equipment
(see Westlink Report for 20 May 1994, p. 3).

Regards,
Vince, WB2EZG

CHINA HAM NEWS 10/28/97
BY1QH Special

Contributed by Lars Melin, SM0KAK
Member, Tsinghua University Amateur Radio Club, Beijing, China

Edited by Rick Niu, BD1QL
MBA '99, Columbia Business School, New York, NY
xn6@columbia.edu

* VHF DX

BY1QH is presently looking for stations who want to try 144 MHz DX, and are located less than 2,000 km away from Beijing in such DXCCs as BY, BV, VS, HL, JT, UA, and, in particular, VK6 (less than 400km from Dampier). The Dampier area is the only location to which it would be possible to make QSOs on 144 MHz using Trans-Equatorial Propagation. Stations interested in working with BY1QH on 144 MHz need to have at least one Yagi (preferably horizontally or circularly polarized), the capability to work on SSB or CW, a good take-off (low horizon) in the direction of Beijing, and a minimum output power of 50 watts.

* EME Report

In the first leg of the ARRL EME Contest, BY1QH worked SM5FRH, SM5BSZ and SM2CEW. The QSO with SM5FRH was the first EME QSO ever from China! BY1QH also heard and identified 11 more stations during the contest. Last weekend, BY1QH worked KB8RQ (first BY to North America on EME!) and W5UN. Also heard was VE7BQH.

BY1QH will participate in the second leg of the ARRL EME Contest on November 15-16. Antenna improvement is becoming urgent as it is not yet wind-proof now. In addition, the club is requesting China Radio Sports Association (CRSA) to clear the much QRMed 144.000 MHz caused by local paging system.

* Contact BY1QH

Tsinghua University Amateur Radio Club is seeking any possible assistance from the international amateur radio community, such as on EME. Please feel free to write to: David Zhang, BZ1BM (bzibm@wg.chnmail.com) or Lars Melin, SM0KAK (lars.melin@era.ericsson.se).

CHINA HAM NEWS is available for unlimited, appropriate distribution.

Maybe not. Do you have the data sheet for the SCRs? Many if not most
SCRs rated at 4 amps continuous will handle a much higher surge for a
brief period. 5-10 times higher is not uncommon.

Forsale: Tektronix 555 Dual-Beam oscilloscope

LOCAL SALE ONLY (for obvious reason :-))

Description:
1. It's fully functional and complete (except for the main power cable,
which you can buy at any hardware stores for around $10-15).
2. The CRT works like new !!!!
3. Two time base plug-ins: 21A and 22A. They are accurate.
You can do delayed trigerring with these time bases.
4. Vertical plug-ins included:
a. 1A1 (2 channel amplifier)
b. L (high speed vertical amplifier, single channel)
c. D (High Gain Differential amplifier)
d. W (High Gain Differential comparator)
5. Cart included.
6. Price: $80 firm, where can you buy DUAL-BEAM scope at this price? In
DUAL-BEAM scope you can see two different signals at the same time
without chopping or alternating.
This scope is big and has separate power supply box.
The number of tubes in this monster is 150+.
Buyer picks up the scope.

thanks for reading,
Rob

Paul, why do you think your "controller" will blow up and not your radio?
Unless you're using an old vacuum tube rig, they both are made out of the
same silicon, and the radio is hooked to an antenna which makes it much
more vulnerable.

That's right, and if you keep exercising the one cycle surge rating, you're gonna be replacing them with "frequency".

Real SCR's are dirt cheap, no sense using them beyond their ratings. I can hear his "Lights" now. What with the switching noise they're going to generate. Thank god he's not my neighbor.

> Cliff, W7VVA

Umm, Cliff, the colorburst frequency tolerance is +/- 10 Hz; see
http://www.access.gpo.gov/nara/cfr/cfr-table-search.html and look in
Section 73.682 of FCC Part 73.

I'm not sure I'd entirely dismiss the use of colorburst signals. A couple
of stations in my area do a decent job of controlling their master
oscillators, and their colorburst signals are between 0.01 - 0.1 ppm; not
good enough to check a quartz frequency standard or counter w/ high
stability oscillator, but OK for at least a coarse adjustment or checking
an uncompensated crystal oscillator. In large markets the network owned &

operated stations may have invested in a Rb or Cs standard as their master oscillator. IMO it doesn't hurt to ask a given station's engineering department how they control their colorburst frequency tolerance.

And I do agree w/ you on the vertical interval time code...I watched a friend's VCR clock get mighty confused one night, trying to synchronize to an appearently wacky/inconsistent time code.

Just my $0.02...

You've described the problem in a nutshell. No one seems to make
a full legal limit (i.e. 1500W PEP output at reasonable IMD, continous
duty cycle) amplifier for 1.8 to 30 MHz. I'm looking for 50V unit,
since I'm not going to use it mobile.

>These units I have up to 96 x 2SC2879, around 12 to 15kw out if you can

Anyone know what 2SC2879's sell for, and where to buy?

I have an old HP DVM, model 3430A I think, which worked when I bought it many years ago but most recently displayed garbage when I turned it on.

I'm trying to decide if I should try to restore it or scrap it and re-use the enclosure for one of my projects. It's a really nice enclosure.

Any advice?

Don't bother - its completely different from the originals and is more
like a beginners guide. Save your money! Most of the stuff in it has
been published before. Inc the design for the single 4XC250B which must
be 20 years old now! Nearly all the equipment designs have either been
published before either in the manual or radcom, or are from VHF comms
and are from that magazine and somewhat 'suspect' (like 3 stage MMIC
amps in the transverters being fed directly to the antenna without any
sign of filtering after them! Sorry but its an expensive flop (20 UKP
price tag!)

Exactly. I love these "Stranded on a desert island with only a CW
transciever" types. They think every man, woman, and child in the
world should be a morse code expert for the one in a million chance
that they'll need it to save their lives. Just another desparate
justification to keep an outdated hazing ritual which is rapidly
killing Amateur Radio (with help from the ARRL.)

Demonstrating to the government that you Know the Holy Code allows
one to enter the Temple of the Holy HF, the Lower Bands Lodge Hall
where only the Good and True amateurs reside.

QEX is a smallish journal (20 pages more or less) which is cover to cover articles with a few advertisments for parts suppliers, ARRL software etc. Its content covers all amateur spectrum allocations. It covers electronics for sure but recently has covered digital signal processing in much detail (lots of math). It also covers mechanical subjects such as antenna rotor stress dynamics etc.

There are usually 3 to 5 articles an issue.

Articles written by various contributing authors are of various reading levels. Many articles are written at the doctorate college level (very intense and I'm sure not comprehesible to many). Other articles are written at a reasonable technical level which is generally above that found in QST. All article usually come with some graphics which appear to have been drawn by the author (not much editing or retouching apparently).

I like this journal and usually read each article. These articles can take an hour to several hours to read and comprehend. However, these article are not as dry as reading an IEEE proceedings journal. The articles are by hams and I think this makes them somewhat more readable.

Try Harris Corporation, Sunair Corporation, Rockwell Collins, Motorola among others that build big solid state amplifiers that cover 1.6-30 MHz.

You might wish to check "Janes Military Communications Handbook", a companion to "Janes Aircraft" and "Janes Fighting Ships" at a larger library. The list of HF manufacturers is a bit longer than what I provided, I'm going from memory (about 3 years and two jobs ago).

# 4014. Crystal Current Measurement

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-29 00:00:00 UTC
From: owens@stout.atd.ucar.edu
Message-ID: <638gg9$krq$1@ncar.ucar.edu>
Source record: 89597

I'm looking for a method to measure the crystal current in a vacuum tube crystal oscillator circuit. I'd like to measure the current to at least 10% accuracy or better. I'd rather not use the light bulb technique that was used years ago to get a relative indication of crystal current. The point of this measurement is to do a comparison of different oscillator circuits and on any one particular circuit to be able to measure and record the crystal current for various operating conditions.

Is there a means of doing this without resorting to the purchase of an RF ammeter that would read down to a few milliamp range? An RF milliammeter of this type would be pretty scarce these days.

The maximum or full-scale range I'm interested in measuring would be 100mA and probably minimum would be down around 5 to 10mA. The oscillator frequency to be measured would be the 1.8, 3.5, and 7MHz ham bands.

Does anyone have direct experience doing this type of measurement that could offer some practical advice?

Thanks! Chip Owens, NW0O, owens@stout.atd.ucar.edu

Yes, they are available from Harris and such. I was in Broadcast Engineering in the 80's
and installed many solid state 1 to 10 Kw AM units and a few FM transmitters as well.
Have wondered myself if the technology has been around why it isnt used as often as
it could be. Perhaps it is because most of the designs tend to use a higher voltage
( Harris for instance uses I think 48 volts in its "lower power" 1-5 Kw if I remember correctly, which I may not...) But this gear is made for continuous duty and the amps
( as well as the transmitters I fooled with ) will be priced accordingly.

Best bet is to look at the latest Handbook and such... Other than that? *shrug*

Good luck

>Are any of them for 2m or above? Simple?

2m and above *stable* VFO. heh, heh, snicker, chortle.
Sorry, free running oscillators aren't what we normally
mean by stable above a few MHz. You can use a VXO,
or you can use a VCO stablized by a PLL or AFC, but
you're not going to get a stable LC VFO at VHF+.

Ok, maybe that isn't exactly true. It depends on what
you mean by stable. If you're doing WBFM, you can
get enough stability out of an LC VFO to be useful.
Figure about the best you can do with LC VFO technology
without going completely nuts is about 10 parts per million.
That's about 1.44 kHz at 2m, not very good. And getting
even that level of stability isn't simple.

A VXO *can* be simple, though. In fact it is almost
always simpler than a VFO. You can pretty easily
get a 200 kHz tuning range on 2m with a VXO,
and it will give you near crystal stability. That's
what you'll want to use until you're ready to tackle
a PLL controlled VCO.

Hi Kevin,
Bob is talking about glass tubes like 3/8 to 1/2 inch diameter
that have a low boiling point liquid in them. They are made in
the form of letters in a sign that has a light in the bottom
for illumination and a heat source. The heat boils the liquid
and bubbles rise in the tubes.
If you see any bubbling radio tubes (valves) let me know.

I've never seen an issue of _QEX_, although I've heard about it. _QST_ offers something for everyone, eventually.

I suggest getting as many back issues of _QST_ as you can. It's far cheaper that way. I can wait a year or two until I can buy years of them in batches with far less money. Most of the technical articles in there won't be out of date for quite some time. I'm not a contester, so I can wait. Any swap net or hamfest will have somebody dumping stacks of _QST_, _73_, and other ham mags.

I'd like to check out the RF spectrum below the AM broadcast band (primarily to listen to aviation beacons and whatnot) and what looks most promising to me so far is a VLF converter made by Palomar Engineers. It takes the VLF band and shifts it to the middle of the 80-meter band on your ham HF receiver. It costs about $80 U.S. Has anyone ever played with this? Good or bad data would be very welcome.

Thanks!

>
> 73 es Tnx, kc4tzn

I read a good article on non-contact AC voltage detectors in the May '97 issue of _CEE News_. According to the notes I took, they work like this.

Capacitive coupling is the key. If you connect an AC voltage across the two plates of a capacitor, an AC current wil flow as the electrons are alternately attracted or repelled by the voltage on the opposite plate. There's a complete AC circuit, even though there's no "hardwired" circuit connection. The electrical field inside the capacitor, between the two plates, is what completes the AC circuit.

When you hold the barrel of the voltage detector in your hand and place the tip near a live conductor, you are inserting the high-impedance sensing element into a capacitively coupled series circuit. Your hand and body form a relatively large capacitor coupled to the floor. The sensor tip is a small capacitor coupled to the live voltage. The sensing circuit detects the voltage and turns on a light or sounds the buzzer.

This type of sensor won't work if you're standing on a wooden ladder, and it won't read a live wire inside a grounded metal conduit. If in doubt, check with a voltmeter.

HTH,

Matt J. McCullar, KJ5BA

Yes, the cell phones are full duplex, but... you can generally pick up
both sides of the conversation by monitoring the base station (867-895
Mhz or so). The base is higher power and easier to hear than the remote
(which is somewhere in the 822-850 area). What you hear is the (landline
phone user) speaking quite clearly and the remote user a little fainter.
What's happening is the microphone in the landline user's phone is
actually picking up what the remote is saying via physical conduction in
the handset. This is then broadcast out from the base. Didn't realize
those mic's were that sensative!

The site http://www.iw7chv.org has been modified. For who already knows
about it will find really interesting news, explained with a functional
graphics to quickly understand what are the services offered. I say
someone for who go to see it the first time:

- HamRadio Search Engine: with over 10000 entries is the most complete
HamRadio Search Engine. You can search/add/modify your URL. It's also
possible to put a banner the first page of the gate.

- Internet <-> Packet Link: You can send mail between Packet Radio
Network and Internet. The service is in testing way..test it.

- Internet Radio gateway: you can browse the gate reading the Packet
bulletins around the HamRadio World.

- TOP 10 HamRadio Site: TOP 10 permit you to vote your favorite Ham
Radio URL and suggest your one.

An more ... HamRadio news, POWWOW community, meteo page, etc. ...

I've seen some commentary on this NG concerning suitable magazines.I suggest that anybody interested in VHF/UHF/Microwave amateur equipment consider The German magazine DUBUS or VHF Communications.They are only published 4 tiumes a year,but you will generally find more useful info in one issue than several years worth of other magazines.

Same thing I thought, but that's what it says. I would think it should
be a bit more complex than that, but maybe it's because they limit the
physical design to a given ratio of thickness vs surface area.

>$2-$3 dollars per watt, for non inductive ceramics.

And you have to be careful because a lot of those non-inductives are
not non-inductive at RF.

As to the price, from a BOM priced out in 1996 from Stackpole.....

90 watt oil 4.94 each
250 watt CCS non-oil 6.32 each
300 watt CCS oil type 10.56 each

>The replacement resistor for the Heathkit Cantenna was
>in the $30-40 range for single units. Most would not
>even talk about a single unit... at any price.

Like I said before, retail or street $30 seems fair in one piece.

>I have 8" and 12" resistors working thru 500 Mhz with
>a flat SWR. We placed a brass strip on each side to
>create a ground plane to make the resitor follow the
>Zo calculations for 50 ohms. The resistor is the center
>conductor of stripline design. (sort-of..)

That helps, but the best idea (as Tom B and myself posted) is to
surround the resistor on all sides and making the line impedance match
the ADJACENT resistance. One end of the resitor is at zero, and the
other at 50.

In other words, at the ground end the line should be zero ohms linearly increasing at the middle point of the resistor to 25 ohms, and continuing until the feed end reaches 50 ohms. Of course the most critical point is near the open end, so you really don't need to go to zero at the far end.

>We made dummy loads for our club where 16 resistors
>were soldered over a ground plane and the SWR never
>moved (1:1). I have no equipment over 450 MHz, so
>I have no idea where it becomes inductive. Bird watt
>meters were used. The 16 resistors, brass, and a
>quart paint can totaled less than $5 bucks per dummy
>load. Medical-grade mineral oil was used as the coolant.

Sounds like a great project. More people should use dummy loads.

You brought up another good point. The Bird 43 meter is rated at + or - 5% of the full scale reading anywhere on the scale. So if we use a 100 watt slug, a within tolerance meter can read 5 watts high or low anywhere on the entire scale.

In the reflected mode, with 100 watts forward on a 100 watt slug, the reflected power can be as high as 5 watts without showing anything, and the meter still be within rated tolerence. That means a 1.6:1 SWR could show up as 1:1, if the same slug set to full scale is used to read forward and reflected power.

Thank goodness for that, because most 50 ohm coaxial lines aren't even fifty ohms. ;-)

> (an e-mail address would be nice) for Communications Quarterly.
> If someone can send me that information, I'd be appreciative.

Yup, good mag. I probably ought to sign up, Barnes and Noble hasn't
kept it in stock reliably of late. Not sure if they stopped ordering
it because I didn't get in for a while or if a couple someones else
bought both copies before I got there.

Comm.Q'ly seems to be the only CQComm magazine not to have its own
web homepage yet.

The CQ Magazine website's orders page
http://members.aol.com/cqmagazine/cqorder.htm
has prices for ALL CQComm. mags, from Pop.Comm through the three CQ
mags (CQ, CQ-contest, CQ-VHF) to CommQ; but it has the full $33 rate for
CommQ, not the hamfest $24 rate *sigh*. If they want to increase
circulation of Comm.Quarterly among hams, maybe they'd offer the
hamfest rate to folks in the reflector/newsgroup?

A 0.1 ohm, 5 watt resistor in each emitter is common practice. Each additional 1.0 ampere produces an additional 0.1 volt, which helps a lot to equalize emitter currents. The greater the current the greater the equalization. This seems a lot better than base resistor equalization.

Hello--
You're probably already aware of this, but not all "2N3055s" are created
equal. If I recall correctly, the original device used a
diffused-junction design, but certain manufacturers sometimes dumped
fallout from other TO-3 production runs into the stamper-- whatever
leftover production devices met the very basic 2N3055 specs.

Thus, you might find a "2N3055" with a much "hotter" (i.e., higher beta and/or higher Ft cutoff frequency) chip than the original device designers ever hoped to produce. So, use a pair from the same vendor if you can.

Re: emitter-balancing resistors-- if your design permits, spec the resistor to drop approximately 0.1 to 0.5 volts at full load. Emitter current produces a voltage drop that opposes the increase in Vbe at higher base-current drive levels.

>to confirm total current and how well sharing is occuring?

The method I've read about is to aim for about 0.5 V drop across the
emitter resistors at full load. This requires pretty small resistances
for high-current supplies.

In practice, 0.1 ohm is about the smallest standard resistor value
easily available, and it also works well. It results in a 0.5 V drop
at 5 A (per transistor). Although the 2N3055 is rated at 10 A, you
usually can't use it at that current anyway because you can't dissipate
the power. So for a 20 A supply, you need to use 3 or 4 pass transistors
for thermal reasons, giving about 7 or 5 A per transistor, so 0.1 ohm
is appropriate after all.

Dave

> an external amp. Does anyone know for sure?

Yes, the antenna does NOT come off the 440 or 2m pocket radios.
These are NOT transverter drivers or amp drivers, they're just
walkie talkies, line-of-site only. You can't even use a mag-mount.
The manufacturer's "Accesory" for using these with a mag-mount is
their dual-band-repeat capable mobile rig! (I don't know if their
mobile has auto-CW-id or not.)

350mW might be enough for a very local packet contact; the 2m radio has a
real metal whip you pull out from the rubber duck. However, you'll
have the altitude of the window you put it in, forget about
roof-mount antenna. Your packet gateway needs to be line-of-site to
the TNC, unless you want to build a very long TNC-to-radio cable
:-)

If you want radio for packet for under $100, you might be better off
buying a used IC-2AT: you get 2W instead of 350mW.

My detailed review of the 440 model at http://world.std.com/~wdr/alinco.html .

The manufacturer's site is http://www.alinco.com/
which includes announcement of their even _smaller_ 2m and 440
radios (for $200, credit-card sized; which is what pushed the price
of these down).

Hi,

I have a new ANZAC DS-808-4 , 20 to 2000 mhz 4 port to 1 port device. It
is either a splitter or a combiner, not sure. Not sure how much power it
will handle but it is rugged. I also have quite a few new mini-circuits
splitters zfsc-2-2b, zfsc-3-4b, and some others that I dontknow the
source of. Big junkbox here.

## 4045. Can Motorola SMR radios be converted to 902-928 MHz???

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-30 00:00:00 UTC
From: Ron Olexa <nospamolexa@reachsct.com>
Message-ID: <01bce564$010ab320$f674a8ce@olexa.reachsct.com>
Source record: 89536

I have the chance to acquire a Motorola SMR HT and mabile unit. They seem to require an external programmer to set their operating parameters. Is there a way to convert such equipment to the 900 MHz ham bands?

Any assistance would be appreciated.

Try the NE/SA 602 by Philips, it's the same one, and much easier
to find (anyway in europe...)

You'll probably get a better deal from
Dan's Small Parts, he has a web page
catalog and I am very pleased with his
service.

If he doesnt have the NE602 in stock,
the NE612 will work, same pin-outs.

I dont have the URL handy, but someone
else here might post it for all the
others out there that need small rf
parts. I can get most everything I
need just from this one source!

I don't have anything to do with Dan's,
just a very thankful and satisfied customer.

Your pal, Tony

PS- I just finished a 31 metre wavelength
shortwave receiver using the NE612....very
nice little active mixer.

I'm presently working on a 15-meter CW transmitter, low power. But still using my HF receiver. If this thing works I'll be glad to send you a copy of the schematic.

I've seen some good 15-meter schematics in back issues of _QST_ magazine, but they're still on my list of circuits to try out.

I can build QRP equipment 7 days week without needing
to know squat about Morse code Vince. (Of course I know
Morse code, but I STILL wouldn't waste my time building
minimalist OOK Morse gear, QRP or not.)

> external gazinta and gazouta parts. Not exactly rocket
> science, but a useful state-of-the-art design with wide
> application..

Hardly "state of the art" by any stretch ... those types
of broadband amp MMICs have been available for many years.
(and building with them is a virtual "no-brainer" ... hardly
worth an article, since all you could possibly need to know
is in the data sheet from the manufacturer)

Also the real utility of such an amp is a bit questionable.
(except in certain types of test setups)

Being so "wide open" ("DC to Daylight") can be a distinct
disadvantage in many areas ... the IP3 of those parts is
not really phenomenal, with the result that a "wide open"
amp is really not well-suited to application as a front-end
preamp ... it most likely would be VERY vulerable to lots of
intermod except in very quiet (RF-wise) locations.

> QEX for November in contrast contains three articles
> describing original experimental work. Described are a 5760
> MHz transverter, a software package for analyzing the
> quality of CLOVER ARQ signals,

The first two were interesting ...

> and a medium wave receiver using a 1.5 volt integrated circuit.

This third one made me laugh. The LO is *radiated* from one board
to another (hopefully only *inside* the case ...) rather than coupled
in a more conventional (and controllable) sense ...

> In addition a column
> presents a brief design of a stable local oscillator for a
> microwave transverter to work with the Phase 3D satellite.
> QEX is much closer to rocket science.

I think it would be fairer and more accurate to say "QEX is as
close to "rocket science" as the ARRL gets.

> You should also consider a worthwhile CQ publication called
> Communications Quarterly. It has interesting construction
> and theoretical articles. I recently subscribed for one

Hello
es thanks for reading this request..

I'm looking for the design of a LNA covering
the 1.2 and/or 2.4 GHz range.

Especially one with a cavity as input transformer.
I have some basic idea about cavities in the
70cm Range ... but not much about GaAs-FETs
or HEMTs and their inputmatching.

So .. is there anybody who can point me
to some resources about this type of
low noise amplifier .. ??
Is there someone who has already built
one ?? What do I have to take care of
in order to get the minimum noisefiguer
out of the semiconductor ??

I'm especially keen on geting the
EXACT numbers for the dimensions of
the cavities ..

tnx for your kind help ...

I suspect that the content of these articles is included in _Communications
Receivers_ by Rohde, Whitaker, and Bucher. It's published by McGraw-Hill,
and the second edition recently became available. It's an excellent book --
you might consider getting a copy since you're interested in the topic.

From: k9sqg@aol.com
Message-ID: <19971031012201.UAA14481@ladder01.news.aol.com>
Source record: 89541

I have found that there are two good alternatives to a non-inductive dummy load. (1) just tune up into a resonent antenna, or non-resonent one with a tuner, on 40 meters any evening on top of a foregn broadcast station. (2) use an inductive resistor and merely use a tuner to compensate for the reactance, the linear will never know the difference. Best of luck to all.

0.1 ohm is often used because it is the lowest commonly available
resistor value. You may wind your own resistors and use lower value,
enamelled cu wire may not need to be drasticly long for 20milli ohm

using a VOM it is often easily possible to measure the differences
between each transistor. Good operational practice for high gain and
easy heat conductance indicates that 5A max is a good choice for such
transistors

Maybe if the home-building of radio and electronic equipment didn't have such a stupid and misleading nickname, it wouldn't be constantly confused with beer and wine making.

The January 1995 QEX has a half wave cavity design for 23 cm,
though it uses the old ATF 10135 device. I haven't done any
work updating this 1992 design for newer devices.

The QEX issues are included in the 1995 ARRL Periodicals CD-ROM.

For the money and security, spend $20 for the appropriate marien battery box
with the single hole for the vent, many have locks too. I could see a
potential accident with the 2 year old if s/he deceided to stick some wire or
other conductive device through the holes in the pet carrier. It's not the
12volts you nned to worry about, its the 150 amps behind it that could be a
problem.
>
>Questions:
>
>1. What car, marine, etc. heavy duty battery is best?

I cannot recommend specific models, but I do know a Marine battery is more
designed for this type of activity thatn a regular car battery. The marine
battery was meant to be "deep cycled" and have most of the power taken out of
the battery and then recharged. If you were to do this to regular car battery,
you'd destroy it about the fifth time you drained the battery. Regular (car)
batteries are meant to stay fully charged.

>2. What battery charger should I use to prevent damage to the battery and
to keep it
> properly and fully charged - without generating rf noise in the
>process (and to
> preferably have a reasonably accurate display of the battery
>condition).

There are chargers that are specifically for Marine Deep cycle batteries, as
they cannot be recharger *porpoerly* with a regualr charger, although it may

work. It won't promote longevity of the battery, which will likley cost in excess of $100. Marine batteries and regualr car batteries are entirely different batteries with entirely different charging requirements.

There are also devices that will charge a battery if the voltage drops below a certain level. This insures that your battery will stay topped off, but I am uncertain as to whether this type of charger, and "topping off" s a good practice for a marien battery.

If you're concerned about the noise from the charger, which you will likley get since the charger is not filtered, a few capacitors from radio shack will easily filter the noise or you can buy a regular car stereo noise filter fro radio shack.

Except that Heathkit (or maybe Knight) made a grid dip meter using
a tunnel diode oscillator many years ago. It cas called a "Tunnel
Dipper".

Wish I had one o' those.

# 4067. Eimac 4CX3000A/8169 for sale

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-31 00:00:00 UTC
From: al.dolgosh@hamradio.org
Message-ID: <8E29271.002C00053C.uuout@hamradio.org>
Source record: 89551

A few years ago (when I was active on 2 meter EME), I planned to build a "conservative" kilowatt amplifier. I purchased a new Eimac 4CX3000A/8169 and SK-1406 chimney, and then I found a used SK-1400 breechlock socket at the Dayton Hamfest.

I really have no plans to use it in the future - maybe someone else would like to build an amp around this tube, which carries full ratings to 150 MHz. It is rated at maximum 5.3 KW out in AB1 linear mode and 11 KW in Class C service.

Filament transformers are available from Peter W. Dahl.

I will sell only as a package:
4CX3000A/8169 (new - unwrapped only for sizing purposes - filament never lit)
SK-1406 air system chimney (new)
SK-1400 breechlock air system socket (used but AOK)

I also have available my homebrew 2 meter KW amp (ran 4CX350's, but 250's just plug in). All it needs is HV, bias is internal and screen is dropped and regulated from HV. I used a 10-watt SSB exciter for 1 KW out. Rack mounted and metered - good looking - no tubes.

Make offer - you pay shipping and insurance from ZIP code 44134. Pickup available if you want to travel.

I have s7 - s9 white noise on 20 almost all the time. I suppose that it is generated somewhere VERY locally. So I want to try to use noise canceling device. Does anybody have any experience with one of these?

As soon as my shack is full of computer noise, I will need a noise pickup antenna outdoors. I know that only MFJ has an external secondary antenna connector. But I am really concerned about poor MFJ quality.

Any experience appreciated.

Historically, that has been very true: US magazines have tended to ignore anything that was "Not Invented Here". The Internet is making a real difference, but if you're an author, you still cannot expect editors to come knocking at your door. You have to take your ideas to them.

QEX is now accepting articles from all over the world, and it has never been easier. For my article in October, I first e-mailed an outline proposal to the Editor to ask if QEX would be interested = which they were. I then wrote the article and e-mailed the Word files directly to QEX.

It is always the author's responsibility to make sure that the article is relevant to the intended readers. For writers outside the USA, this goes double! You can make sure that the content and presentation is relevant to US readers by e-mailing your draft article to people in the USA whose judgement you can trust. My QEX article on tetrodes required major changes as a result of comments from the USA - not changes to the basic ideas, but changes in the way they were presented.

The easier you make it for the magazine, the more likely your article is to be published. If you make the magazine do all the work, your article will certainly take much longer to be published - and it may never happen at all.

All you need do is change the 11.3258 Mhz Mixer crystal to a higher freq.
For every 0.150 Mhz increase in freq of this Crystal you will get a
450Khz increase in operating freq.

Today this unit uses a MB8719 PLL. This PLL is running in the middle of
its operating range. Even with this crystal at 11.3258 Mhz the upper limit
of the operating area is 28.235Mhz and as low as 26.335 in 10 Khz steps.
To do this you would need to provide an external method of changing the control
lines to the PLL chip. Since the channel selector switch does not allow a
direct control over the PLL divider lines you can provide extrenal control
lines for the PLL that will allow you to get a larger range. Other factors
will get involved as well. Like the Last Xmitter mixer, and the VCO range,
but if you can live with a 450 Khz spread in the 10 meter band then just get
a crystal in the 11.5 ~ 12.0 Mhz range and retune the Mixer coil.

> > > 3055 was HOT as HECK. Other 3055 was stone cold. Not sharing current

Definitely use emitter resistors. Bigger is better. If I remember my
math, 60mv drop will cause 10:1 current change. For the same type
transistor from the same manufacturing process, 100mv should be
overkill.
For generic 3055's from different vendors, I'd go with half a volt
overkill.

There's another reason that base wires go. If the base drive is
stiff and you put a heavy transient load on the emitter, the transistor
takes some time to react. During that time, ALL the emitter current
tries to come out the base. Typical place this happens is in the
current limit transistor when people fail to put a base resistor in
the limit sense transistor. Sooner or later, the transistor will fail
with an open base.

Anyway, if your transistor's max base current spec exceeds the output voltage divided by the base resistance, you're probably OK.

Hi Ian--

>QEX is now accepting articles from all over the world, and it has never
>been easier.

Comm Quarterly has been accepting foreign articles and soliciting foreign reprints since inception, and the new editor of QEX--a former Comm Quarterly author--appears to be following that lead. I think we'll all benefit from this approach. I'm optimistic that Rudy will do a great job with QEX--and we'll all be the beneficiaries.

I said they have been available for many years ... MiniCircuits "MARs"
and Avantec/HP "INAs" etc. ... the point I was trying to make is that
they are NOT some new, "wiz-bang" development and that a "wide-open"
amp such as the article describes has some potentially serious draw-
backs, which the article seemed to ignore ...

> > > (and building with them is a virtual "no-brainer" ... hardly

> > > is in the data sheet from the manufacturer)
> >
> > True, *if* you are familiar with UHF design and construction techniques.
> > Obviously, such people weren't the target audience of the article.

I repeat ... virtually everything that one could possibly need, including
explicit advice on grounding, bypassing, etc. are available in the mfgr's
literature ... check out a MiniCircuits catalog.

Obviously ANY criticism of ANYTHING that the ARRL does meets with quick
and certain spin-doctoring response from the loyal staff. Next, I
suppose, the league will have counsel petition the FCC to make it a
violation of Part 97 to utter any words criticizing the high and mighty
ARRL???

# 4075. Velvet Verniers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-10-31 00:00:00 UTC
From: dledoux@laci.net
Message-ID: <63e16k$kn5@news1-alterdial.UU.NET>
Source record: 89559

Well, every job has to have its fringe benefits. In my case, we are de-installing some fifties-vintage carrier receiver-transmitter units. These are tube technology, and each unit (I have access to two) has three "Velvet Vernier" drive units with approximately 6" diameter logging scales (stainless steel). Two of the drives are connected to large variable caps (probably up to 300pf and good for antenna tuners up to maybe 150 watts). the third drive on each unit is connected to a variometer inductor suitable for the frequency range of the units, which is in the 80-90khz range. An additional couple of capacitors have direct drives with beautiful 3" stainless logging scales.

Now, the nitty-gritty: I know that this stuff is BIG for a lot of the backpack up Mt. Whitney QRP crowd, but for us homebound ops, this is the makings of some fine equipment. Velvet Verniers used to be one of THE best-known reduction drives. I plan on keeping a couple and parting with the rest. What are such things worth?

Thanks
Dale

Excellent message, Jan-Martin. I had a brief subscription to QEX back in the late 80,s and I let it expire. Just too darn boring. TOo much advertising for the articles...which were not very cutting edge. My own preference was HAm Radio, about a year prior to it's demise (and earlier). Kickin' articles, very little advertising. My subscription to VHF Communications (UKW Berichte for you Europeans) expired some time ago...mostly due to irregular and undependable AMerican distributors.

I had written to the QEX editor a number of times, offering copies of tech manuals to those asking of them. THe editor really did not want to be bothered, and it took several months for him to "connect" me and the askers. I'm not impressed with QEX. Period.

If a person wants to go homebrew, get as many European subscriptions as he/she can. Forget QST, unless you like 125 pages of advertising. A lot like reading the Sunday paper auto section.

Source record: 89472

With the help of the members of the Internet HB/QRP community, I'm gradually getting my little 30 meter transceiver in shape.

I took a Kanga Sudden RX and paired it up with a simple VXO controlled transmitter. I took the oscillator energy from the transmitter at the output of the buffer transistor and connected it via RG-174 and a coupling cap to the NE602.

The arrangement works, and I've been making QSOs, but the rig is plagued by annoying "pops and squeals" that occur when (on receive) I tune the main tuning cap. The noises come when the cap is a mid-range (its not just when the caps are fully unmeshed). For a moment I thought I might have been hitting a bit of dirt or dust on the plates, but they look clean and there is no indication that they are coming into contact with each other.

Any idea on this problem?

The basic criteria are the same everywhere, of course, but readers in different countries will start from a different knowledge base. This is partly due to the selective coverage of magazines and books in each country, but also because amateur radio in each country has a unique national flavo(u)r. An article by a writer from another country has to take account of this, or else it is not meeting the local readers' needs.

Some of the presentational changes in my QEX article were inspired by your own comments, Bill - for which I remain very grateful.

Have been using a GAP Titan for a while. It does work, with the primary advantage being single coax feed for 8 bands and theoretically, no tuner, instant band switching. Not a very effective radiator on 80M, obviously, but improving as you go higher. Usually, my 15/20/40 meter dipoles at 35 feet have a better signal, but not always. Sometimes on DX stations the GAP is better. Oddly, my GAP has a lower background noise than the dipoles, but then so does a 50 Ohm resistor! Since you really should keep this antenna 40-50 feet away from the house, wiring, metal structures, etc., its kind of hard to claim that this type of antenna require "less space" than a dipole. Mine requires a tuner to get to the CW portions of 10 and 15 meters, YMMV. I am deep in the woods and am never exposed to high wind. The Titan definitely should be guyed if you have any exposure to wind and/or icing.

They do. And it can be seen from your handbooks to UK versions.

In the US versions you have a tendancy towards single board transverters and LO instead of the UK versions which sort of 'bolt together' using individual modules.

US amateurs do seem to like their articles different from their colonial cousins across the pond!

I'll second Jim's thoughts. However, you can put it closer to the house. Mine is about 3' f/the nearest rain gutter and 4' to a metallic storeage shed. Obvisiouly, I had to adjust most bands, except 80 M where it exceded specs w/ 230 KHZ bandwidth. Never tried 80 M DX, as I am not impressed w/the caliber of conversations. Have worked European DX f/ 40 to 15 M in the 4 weeks that I've owned it (100 watts). Most bands have under 1.6 SWR w/o tuner at radio.

Gene,

The JPS unit (ANC-4) also has an input for an external noise antenna.
It also has a money-back guarantee if you don't like it. Buy one, see
if it takes care of your noise problem, and if it doesn't, send it
back. All you're out is shipping.

# 4098. AD607 SSB/CW Reception

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-01 00:00:00 UTC
From: mtnclimb@aol.com
Message-ID: <19971101003901.TAA19695@ladder01.news.aol.com>
Source record: 89566

Howdy,

I am continuing on with a 20 meter RX design. I am considering using an AD607 as the meat and potatoes of my circuit. Has any one used this chip to to receive SSB and CW? The demodulator on it is a QAM demoudulator with in-phase and quadrature outputs. It is controled by a PLL VCO. The data sheet says that phase locking the VCO to an external BFO at the IF freq, will allow you to receive CW and SSB. The question I have is will m(t) (the message signal) be directly available at the I output to drive my AF chain, or do I need to sum the Quadrature and in-phase outputs together to obtain m(t)? If anyone has used QAM demodulators to demod SSB and CW, please let me know the best way to do this with respect to the I and Q outputs.

Thanks,

A speaker can also be the final filter. Mosot speakers are a ggod low
pass filter with the knee at 15Hz to 20KHz. Thus some distortion is
never heard.

Hi Cliff,

> Does anyone have a phone number for Tech America? The email
> address: http://www/techam.com does not work. Cliff K7RR
^
You inadvertently used the / instead of the . in the address.
Use this: http://www.techam.com

Another door to this company is through Tandy:
http://support.tandy.com
You can get FAX Back documents for Tech America products as well as Radio Shack and Computer City. Or click on the document number of the desired product and read it on the screen of your computer. I prefer this approach over Faxback. The Faxback number is 1-800-323-6586 You just follow the instructions given and you can enter the catalog number to get a document listing via FAX so that you can get the documents. It is faster via the web site. One hint if you make a Faxback search. If you are wanting a specifications doc for Radio Shack's speaker microphone on page 72 of the 1998 RS catalog part # 19-314. You have to change the prefix and suffix to fit the search parameters. The number has to be 3 by 4 or a total of 7 numbers such as 1900314. If you enter 19314 you may get a document for something else as the document # contains 5 numbers. You will be given a choice to enter the doc number or the catalog number. Depending on the number count, determines what is sent. When in the web site you can drop them a note for what ever you can't find. They monitor it well and they have an answer the next day via E-Mail. The DX-394 Communications Rcvr cat# 20-224, I tried to enter 20224 on the telephone and they sent me a list of documents for a AM/FM pocket radio via FAX. I got on the web site and I could not find anything referencing the receiver. I dropped a note and they sent me a dedicated web address that contained all that I needed to get the documents. By the way, FaxBack is a free service.

Bill, you have probably located the problem, but didn't look quite
hard enough. The problem is likely poor contact to the capacitor
rotor. This is a wiping contact, of course, since the rotor has to
turn. It could be oxidized or dirty. Or it could be somewhat loose.
Try a shot of tuner cleaner on the wiping contact and see if that
helps.

Need a Good Laugh?

http://www.potg.com/
See: Why everyone on the internet is talking about this progressive new website; why up until now, this site has grown simply by word-of-mouth.
Hear: The show that is breaking boundaries on the radio, making it an entertaining medium once more, and why certain sites have already heralded it as "the show that will redefine radio and will usher in a new style of comedy for the 21st century."
Taste: The difference between Planet of the Grapes' potent style of humor and the type of humor that makes you turn off your television or radio in disgust. The show's hosts guarantee that whether you like it or not, it is impossible to deny that it has a unique, fresh style.

The Hosts: Deaze Beans, Yahdderman, and U.B. Jackson
The Show : Planet of the Grapes
The Site: http://www.potg.com/
The Reason: Join the bandwagon that is headed into the future of comedy!

That's true. However, you *can* achieve ranges in excess of
1000 km if you use coherent digital techniques. These are pretty
easy to implement directly in hardware due to the low frequency,
IE you can do it with garden variety CMOS.

Or you can use software on a PC to implement them in conjunction
with a more conventional radio. This band offers a great opportunity
to learn about these techniques at low cost. And these techniques
are your only practical choice if you want more than a few km
range on a regular and reliable basis.

Note that these same techniques can be of great benefit at HF too,
but the signal levels at HF are often high enough not to require
them. So you can frequently get by with ordinary RTTY/SSB/CW
if you don't mind having to use excessive power.

> 1/4 HP 125VAC
> 1/2 HP 250VAC

Beautiful Question - Tom. Most people just assume that it doesn't
matter whether it's an AC application or a DC application.

In general, a mechanical switch can handle a MUCH larger AC current
than DC.

Here's the explanation:

An AC current passes through zero twice every cycle. That means that
the arc that forms when you open the switch is SELF EXTINGUISHING.

In contrast, a DC current tries very hard to maintain the level of DC
current flowing when you open the switch. This attempt at maintaing
the current level is due to Lenz's law, E=L di/dt. The amount of
energy available to keep that arc alive is the amount of energy stored
in whatever inductance there is in the circuit (every circuit has some
inductance, however small). The stored energy is 1/2 x L x I^2.

Here's how that energy gets used, and this is the part the people have
a hard time understanding. Whatever arc current flows at a given
moment is in the process of decaying, but the reduction of current is
a di/dt or a "rate of change" of current. That di/dt or "rate of
change" produces a proportional voltage from Lenz's equation. This
voltage is enough to sustain the arc, but remember the energy stored
in the inductance is continuously being used up or dissipated in this
process.

So, eventually the arc extinguishes, but only after the enery is all
used up, which takes either a long time or very quickly, depending on
the amount of inductance. The total energy dissipated in the arc is
proportionate to the level of DC current that was flowing at the time
you opened the switch.

Since it's the arc that burns the contacts of the switch, the bigger the current and the bigger the inductance, the quicker the switch is burned out. As you can see, the switch's duty rating has to be specified in terms of how much DC current is can break. But the switch manufacturer DOESN'T KNOW how much inductance is in your circuit, he can't tell you how many times you can break that arc before it's burned out. Therefore, you won't see a DC current rating on most switches. On those switches for which you DO see a DC current rating, it's shocking how big the switch has to be for something as moderate as an amp or two. This is why most switches carry only an AC rating - they really don't even want to get into the realm of DC currents and their associated problems - they know you would be scared off by the teensy-weensy little DC current rating.

I wouldn't use your "6 amp" switch at anything higher than 1 amp DC and even then it won't last long.

Lightning is a common cause for that type of failure in a power supply.
Not a direct strike, just a nearby one.

I, personally, fear no name power supplies. My ham gear rates better than
that. Astron has been a VERY reliable unit in my business (commercial
2-way) and has excellent protective circuitry (for connected equipment).
I would question the quality of ANY equipment that didn't follow even the
most common practice as emitter resistors on parallel transistors.

Ken,

Looks like good answers to your question.

If you would like electronics projects, other than ham radio related, look at an issue of Electronics Now. I take QST and Electronics Now for the technical articles. I stopped QEX but still get the ARRL Handbook every couple of years and the 1996 ARRL Periodicals CD which contains a years worth of QEX (just in case).

Locate Electronics Now via "http://www.gernsback.com/". Good luck.

Possibly the ARRL handbook. However home crystal grinding was only
feasable for air gap crystals and they are seldom encountered these
days.
I have sucessfully moved the frequency of 1 to 5 MHz solder seal
crystals by using a soft pencil to transfer graphite onto the non
polished electrode surface, this can lower the frequency by up to
2000ppm always wash and dry the crystal after( try vodka! ) or other
residue free solvent.
When modern crystals are manufactured they are ground to about 5000ppm
above the required frequency. The electrode is evaporated on to reduce
the frequency to the exact value. You can also electro plate/deplate to
change the frequency.

I am afraid that with modern crystals which tend to be smaller in
diameter and with evaporated metal electrodes rather than air gap
holders 1mA should be regarded as an absolute maximum before the
parameters change permanently. Note good modern crystals drift less with
time if not driven over 100uA I know this makes a QRP rig more
difficult.
Note that current is not really the limiting factor, what damages
crystals is the real movement of the vibrating surface.
With a high Q crystal say 1000000 the surface will move further for the
same current than a 10000 Q crystal.
Clearly mA/area is involved ahd therefore a tiny crystal such as an XY
flexure watch crystal must be driven even less hard

Here it is... I keep a notebook with articles about crystals (a hobby within a hobby) and found an article called "Techniques for Grinding Crystals" by Michael Simmons, WB9CWE. It appeared in the July 1991 issue of _CQ_ magazine. It's only two pages long, but very readable. Unfortunately, I do not have access to a scanner. But I'd be happy to stuff a copy in an envelope and snail-mail it to you.

Closest thing I can find immediately is a 1500-watt amp for 160m using
an Eimac 3CX1500A7/8877 in grounded-grid configuration. This article is
in the 1991 _ARRL Handbook_, and I think it was in the 1988 version as
well.

I would suggest something is wrong with the thermal resistance. If one collector is cold and one is hot, why did not the hot transistor heat the cold one - at least to some degree? Did you remember thermal compound? Several manufacturers don't seem to understand this. We had some problem with some general fault for some equipment that the voltage regulators were rather hot while the cooling fins were cold.

my favourite type of simple +12V regulator type uses 2x2N3055 with collectors direct to chassis with 7912 regulator - with 15VAC transformer etc. I made one for 5A and one for 10A. Either uses 2x3055 - they are cheap and two transistors outside the die-cast box improves the heat problem

Thanks Peter for the reply. I'm using a full wave horiz loop fed with
450 ohm ladder line through the balun in a Nye tuner. BTW, I was also
getting the same problem on 80m at one point, but it "went away" on 80m
(just a normal dipole with choke balun at feedpoint, 1:1 match). It does

sound suspiciously like RFI in metering circuitry, doesn't it. I have a few 8 ft rods in the earth a few feet outside the window connected to the shack with 1" braid. Still, there may be rf in the metering circuitry.
Don't know. Thanks for your ideas. Any more, let me know.
George

## 4129. Seeking non-appliance operator hams for small microwave/VHF group

Newsgroup: rec.radio.amateur.homebrew

The article I talked about here on crystal grinding uses Comet, a commercially available powder abrasive used for cleaning bathtubs and sinks. You sprinkle a bit onto a sheet of glass and add just enough water to form a smooth paste. Get those little pieces of grit out of it, though.

I haven't tried this myself, but I do know that you can remove scratches from compact discs with Brasso metal polish. Would it work on changing the frequency of a crystal? I ought to try this. I've got several crystal holders...

Here's a gag that wrote itself. For lack of anything better to keep all my crystals in, I use a glass coffee jar my folks gave me a while back. So I put a label on the jar: "Folger's Crystals."

The original _CQ_ article also recommends diamond rogue, if you can get it. This is the stuff that jewelers use.

But, hey -- if toothpaste can clean your fingernails, it ought to work on a crystal.

# 4132. Homebrew 4CX1500B Amp $500

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-03 00:00:00 UTC
From: ae4cz@aol.com
Message-ID: <19971103022900.VAA01725@ladder02.news.aol.com>
Source record: 89508

I have a homebrew amplifier for sale. The bulk of it was purchased as military surplus. It consisted of two 4CX1500B tubes, sockets, and chimneys. It was designed to operate as a sonar amp on audio frequencies so it did not have an RF deck. I purchased all the parts needed to make it a ham amp and assembled it using only one of the tubes. The cabinet is on wheels and the thing weighs over 100 lbs (the transformer is huge). It is as wide as a rack mount (19 in), 2 feet tall, and 17 in deep. To make a long story short, the amplifier works and puts out 900 watts CW on 10 - 160 meters. I think I need a parasitic mod because I have trouble tuning it on 20 and above. 40-80-160 seem to work great.

I will try to sell this amplifier as is for a few weeks before parting it out. It consists of the following that I have purchased:

Military surplus amp-----------------------------------------------$250
2 @ 4CX1500B Pulls ($100 ea)
2 @ SK800B sockets ($30 ea w/chimney)
2 @ SK806 chimneys
3500 V transformer ($50)

Jennings UCSF-500 vacuum cap (12-500 @ 7.5 kV)--------$100

Jennings CVCC 2500 (25 - 2500 @ 6 kV)--------------------$100

2 @ Groth turns counters $35 ea--------------------------------$ 70

32 uF @ 4.5 kV power supply capacitor------------------------$ 36

B&W 852 tank coil w/ integral bandswitch---------------------$ 60

HC1 Kilovac SPDT vacuum relay (same as RJ1A)------------$ 40

Meters, relays, knobs, chokes, doorknob capacitors,
power resistors, hardware, etc.-----------------------------------$ ??

-----

TOTAL
-----------$656 +

PURCHASE PRICE FOR ALL PARTS AS IS:-------------$500 firm

My plan was to redo the amplifier and put the second tube and socket back in it to boost the power level but I do not have the time to work on it. All the parts are heavy enough to handle the load. I hate to part it out because the amp does work and it has many features of high quality commercial amps (voltage regulation, timer delays, vacuum relay, overload protection, vacuum capacitors, etc). I have drawn the schematics for all boards on the amplifier (most are original commercial but a few are homebrew).

I am certain I can get at least the $500 if I part out the amp. If you are interested, please call, email, or stop by my house to check it out. Unfortunately, as heavy as this amp is, I cannot ship it.

Does anyone know a source of the 6 connector rectangular plugs that is used on Knwd and Icom HF transceivers such as the TS-430, TS-50, IC-730? It is similar to a MOLEX plug but has the individual contacts surrounded in plastic. The brand name cables are pretty expensive.

Hi George, here is what I use.

Linkname: Cross Reference Search
Filename: http://www.nteinc.com/cgi-bin/nte

NTE Electronics, Inc. Product Information
URL: http://www.nteinc.com/Web_pgs/Prodindex.html

Locate Nearest Distributor
http://www.nteinc.com/NET_St_lst/Disty.html

PHILIPS ECG PRODUCTS
http://www.epsilon-assoc.com/~starkel/ecg.htm

The Philips ECG uses the NTE site when you do a search from the Philips
web site, the last time I was on-line. I dropped a note to Philips and
asked if they had bought NTE. The answer was no and since the NTE is a
mirror of ECG they agreed to cooperate on the use of NTE's cross
reference site. Another electronic search site for electronic parts
manufacturers and vendors, use: http://www.electrobase.com/index.htm
manufacturer and venders search. This will give addresses and phone
numbers with 800/888 numbers when available.

You might try DejaNews.

There's one fella that sells a hacked up molex connector. The problem with the molex is that the D-shaped plastic keys face the wrong direction, and the inserts are ALMOST the right size. I got three of these connectors for $10, and I was able to make them work. You can probably shave one corner of the two offending Ds yourself and save a little money. You also have to build a "squeeze tool" to shrink the inserts a little bit. I drilled the center of two pieces of angle and put the resulting "squeezer" into a vice.

In response to an article/ad by this first guy, another responded that the connectors (without the cable/fuse) were themselves available from ICOM for about the same $. The advantage is that the "real" connector also has a locking mechanism that keeps 'em from falling off (really required for mobile operation, not so necessary for fixed).

Good luck,

Jim Wilson,
WA5BRB

I called up ICOM Tech Support with some technical questions about my IC706.
I asked them if I could purchase the connectors? They sent me
a connector body and pins - no charge.

Keep in mind that the pins carry a substantial current. The wire should be
properly crimped to the pins. The pins are similar to Molex pins so a Molex
Tool should work. If no tool is available the wire should be soldrered to
the
pin.

# 4140. Re: 2N3055 Current Share Resistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-03 00:00:00 UTC
From: tomb@lsid.hp.com
Message-ID: <63la6v$509@hpcvsnz.cv.hp.com>
Source record: 89516

J M Noeding (la8ak@online.nospam.thanks) wrote:
: 0.1 ohm is often used because it is the lowest commonly available
: resistor value. You may wind your own resistors and use lower value,
: enamelled cu wire may not need to be drasticly long for 20milli ohm

One interesting thing about using copper wire in this application:
Normally, you'd want resistors which are temperature stable, and
copper has about 0.4% per degree C positive temperature coefficient
of resistance. So..normally, you would want to be careful about
using resistors wound from copper wire. But in this application,
as the side drawing more current heats its resistor more, it tends
to further balance the current between the two sides.

Another thing: The original poster noted that under 0.3A load
test, one transistor gets HOT. That's a really bad sign in a
power supply which is supposed to handle up to, um, what was it?
8 amps? Dave Martindale mentioned the possibility of just a poor
thermal contact of that transistor to its heatsink. Perhaps.
Or...could there be more going on here?? Could there somehow
be more load than you think? Seems unlikely if the two transistors
really do have paralleled collectors and emitters...but it seems
worth checking out further. Even if it's 0.3A into a short circuit,
with 22V to the collectors, that's only 6.6 watts, not so much for
a 2N3055 with adequate heat sink. If it's into a load at 12 volts,
then it should only be about 3 watts!

In the US versions you have a tendancy towards single board transverters and LO instead of the UK versions which sort of 'bolt together' using individual modules.

That may reflect the views of the editors and not necessary those of many practitioners.

US amateurs do seem to like their articles different from their colonial cousins across the pond!

See also the thread concerning ARRL vs. RGSB publications.

## 4143. Re: cheap ARRL paper [was: RSGB manual for Canucks]

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-04 00:00:00 UTC
From: n1ddzrjc@aol.com
Message-ID: <19971104005401.TAA05591@ladder01.news.aol.com>
Source record: 89427

It's not the content that makes the RSGB books more expensive, it's the paper. ARRL uses,which is, unfortunately, a very cheap, acid paper that tends to turn brown and brittle. On the other hand, you may not happen to care if the book is around in 10 or 15 years. Sams publications also use a very inferior paper that will not last more than about 15 years.

Good books are made from good paper. I won't buy the ARRL books that use this "newsprint".

Source record: 89431
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap

I have a 75A1 with the 270G-1 speaker and a 312B-3 speaker. Cosmetically all are about a 7.5. I have the original (and very pristine) manual for the A1. Electrically the A1 currently is in need of some TLC. The audio gain pot is defective, the other pots and switches are very noisey, and most likely some of the tubes are soft. All units are restoreable to collector condx, but with patience and a loving heart.

I do NOT want to sell but would rather trade. I would throw in my TS-930SAT with this package and trade everything for either a Knwd TS-850SAT, Corsair II with accessories, or OMNI V.

thanks for the read

I just read a chemistry book (I'm a student) which mentioned that the maximum constant exposure limit to HF is 2-3 ppm, for hydrogen cyanide it is 10 ppm; and as we all know cyanide is not particularly good for you... I would do the etching outside, wearing proper chemically resistant gloves, safety glasses and a lab coat or similar. Oh, and glass is etched by HF so you will have to use a propylene or steel (apparently steel is inert to HF) container. The QRP Circuit Book (unsure of the name) here in the UK has a page or two on xtal etching using toothpaste and carborundum powder, much safer.

73 & good luck,
Laurens M1CCO

Hello everyone,

I have an Yaesu 6m transverter that was damaged becuase the FT-77 that I was using with it decided to output RF into the receiver !. I need to replace 2 x 3SK51 Fet's but I am having a problem getting them in this part of the world.

I would like to know what equivalents I can use that would not require a mod to the tranceiver (FTV 700). Any information would be of great help !

Thanks,

73, Rudi de ZR6VE

Site License puts Simulation & Synthesis on Every Desktop

For general analysis with noise capability, filter and structure
synthesis, and system and receiver engineering support, the
Webb Laboratories Professional Partnership Program is
unprecedented:

http://www.webblabs.com/pp.htm

The one-time $975 investment in the PP Program will drastically
reduce your annual software budget, freeing up dollars for
other needed equipment and analysis support tools. The
larger your company or organization, the lower the PP Program
cost on a per-user basis - the $975 licensing fee is for site-wide
use, and there are no annual fees! More information available
on request - free shipping worldwide!

Kathy Goerg

## 4158. Re: 1750 M and antennas

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-04 00:00:00 UTC
From: Maurice Lewton <mplewton@ix.netcom.com>
Message-ID: <63ofke$t3e@sjx-ixn4.ix.netcom.com>
Source record: 89442

You must use a loading coil, you will have to wind it yourself, and a
adjustable tuning capacitor across coil. Connect your antenna, 50' (Max I
think - check rules) to the hi end of coil, and ground low end to your power
line ground. Wind a secondary winding approx.. 1/50 turns of the primary.
Use this winding for coupling to the transmitter.
You will have to determine the amount of windings needed to get it to
resonate at you transmitter frequency. Following is message I sent today to
another person.
xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

In the early 1980's I built a 1750M xmtr and rcvr. I hooked it to my OSI
computer,sending CW, and let it run day and night for about a month sending
a simple message. My name and address, xmtr output, antenna length, name
and address. The greatest range for a reply was approx... 60 air miles.
Got many replays up and down the coast within that range. Xmtr was running
about 1 watt to a 30 foot vertical, using PG&E for a ground. Still have the
transmitter and a mobile transmitter/receiver. They still work. Don't have
my antenna loading coil or the Vertical antenna.
Receiving at this frequency is very difficult due to the power line,
dimmers, etc... noise. When I would take my mobile receiver several miles
from power lines I could receive quite a few signals.

This is going to be difficult to locate, but I need a schematic for a Navy Transceiver model TBX-6 (CG 43005C) (s/n 245). This unit is in mint condition, but I would like to be sure what the power requirements are prior to applying power. Uses 4 type 34 tubes, 1C6 and 837 transmitter tube. Covers 2.00 to 8.00 MHz AM and CW. Probably made before WW II.
If anyone has such an old schematic let me know.

There certainly seemed to be a change in paper stock during the 70's. My 68, 69, and 70 handbooks still look bright white, but from 71 through 77 (and perhaps later?) the paper has gone through various degrees of yellowing. Curiously, my 71 copy is yellowing *except* for pages 257 - 288: looks like a nice white racing stripe!

A 47 handbook in my bookshelf is also very yellowed, and just by feeling the paper you can tell it's cheap. Did the ARRL use more than one printer?

Thanks Harold
I am pleased to see that there are still some air gap crystals in use.
Younger experimenters may never have seen them at all. I mentioned
solder seal as there is still a possibility to unsolder & change
frequency by 0.5% by non abrasive means.
My first crystal company used to buy old lowish frequency air gap
crystals because the material was natural (not regrown) therefore
usually high Q quartz (6000000). They took the quartz out diced and
made modern crystals with the material. If anyone has a significant
quantity they may still have some value for this purpose.
As I stated earlier the bigger the piece of quartz (for a given Q) the
more current it can take so they can be run much harder.

Perhaps the older books were better printed. I have a 1990 Handbook whose
pages are already quite noticeably brown. It has always been treated well.
It's not just brown at the edges either - the pages are turning colour
uniformly.

# 4176. Resistor's 300 ohm 10 Watt

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-05 00:00:00 UTC
From: robertc908@aol.com
Message-ID: <19971105181000.NAA00649@ladder02.news.aol.com>
Source record: 89460

I have four 1 pound coffee cans full of new 300 ohm 10 watt power resistors. They have wire leads. Well trade for other parts, I pay postage to you or you pay postage for amount you need.

73's
Bob, W4RLC

## 4177. Diagrams

Newsgroup: rec.radio.amateur.homebrew

>strength,
>receiver circuits, antenna, etc and experiences... Thanks.
>
>
You'll have no problem as long as you have a good ground> Much more important
than a good antenna, which is impossible at this frequency. 30 foot voltage
fed vertical against good ground feeding "active antenna" type FET amplifer
sort of thing will do FB (Source follower with Hi-Z input)

W4ZCB, 3 hours East of you in NC.

Message-ID: <34514cd6.0@news1.ibm.net>
Lines: 36
Path: nntphub.cb.lucent.com!uunet!in4.uu.net!news.monmouth.com!news-pen-1.sprintlink.net!news-east.sprintlink.net!news-dc-26.sprintlink.net!news-peer.sprintlink.net!news.sprintlink.net!Sprint!newsm.ibm.net!ibm.net!news1.ibm.net!129.37.122.83
Xref: nntphub.cb.lucent.com rec.radio.swap:136999
Content-Length: 1228
X-Lines: 37
Status: RO

I have found a source for those DC power cord plugs. Very close to
factory, male plastic with 6 metal female (barbed) inserts.

The plug fits most 12VDC HF radios:
Icom 701, 720, 730, 735, 740, 745, 706, 756 ...and alike,
newer Yaesu and Alinco DX70.

Kenwood-TS120, 130, 140, 430, 440, 450, 850, 870....

Kenwood-TS50, 60, 660, 670, 680, 690...and more.

Make your own power cord yourself, YOUR WAY!
Crimp or solder, short or long, heavy gauge wire,
purple with pink polka-dots .... whatever!

Each DC Plug comes complete with 6 crimp/solder inserts
for $4 each, or the deal 3 for $10.

All prices include postage in the US and Canada.

To order, kindly send a check in US funds to:

Robert Langston
286 Hudson Street
Cornwall-on-Hudson, N.Y. 12520

You can also email me for info at: n2cjj@ibm.net

It's a great deal if you use one rig at home, in the car or at work
and are stuck re-connecting and dragging the power cord all over....

It sure beats paying $32 for a spare from your dealer.
If interested, I'm located about an hour north of New York City. I work in central New Jersey...So I could accomodate a wide range of 'meeting you somewhere'.

Home phone is 914-534-9925, or here at n2cjj@ibm.net

Source record: 89465

I have ground many crystals, in the type FT 243 holder. 6.8+ MHz can be moved up into the 40 Meter band, 5+ MHz crystals will not make it with any activity left. You can only grind up in frequency. I used a glass plate with water, Bon Ami or Comet Cleanser as a grinding agent. You have to go slow, grind a little, clean, then assemble the x'tal and test it. If you overshoot a few kHz, you can put a pencil mark on the x'tal and it will bring it down slightly - also reduces the Q.
In fact when I noticed this post, I went out in my crystal box and lo and behold there were all my reground 40M and 2M crystals, they were ground in 1961 through 1964. Grinding 8 MHz crystals for use on 2 M was really difficult, but it works.

If you REALLY want home construction, subscribe to 73 Amateur Radio today. Then you get Uncle Wayne's editorials too.

Other than the DDS articles and maybe a few others, i haven't seen that much that distinguishs its homebrew articles over those of QST. If anything, i'd be more cautious about issues like spectral quality when considering a '73' project. On the other hand, the "Above and Beyond" column has some helpful stuff in it and topics not often seen elsewhere. I wish there were an entire magazine (or mailing list) with that focus.

I keep files of interesting projects and construction oriented articles and i have alot more serious stuff from QST on file. But as Gary (KE4ZV) points out, the details necessary to do your own projects are largely lacking in both sets of publications.

Standard small AT cut crystal designs are limited in Q by their
dimensions however low frequency overtones like 5 and 10MHz third
overtones can be achieve Qs of 3 to 6 millilon with low loss quartz.
Fast grown modern quartz often has a limiting Q of less than a million
and limits the Q available from better designs.

I am trying to straighten out a circuit for an Old Timer friend. He built it over a year ago and hasn't been able to get it to work. It is an Audio to Push to Talk circuit that appeared in 73 Magazine in January of 95. There seems to be a problem with a change in the size of R5 and R8. There is an update in the May 95 issue but I don't have any issues past that and it doesn't mention those resistors. Has anyone successfully built that project? Any help appreciated.

The industrial temperature range '602, I think SA602 is available at the
NE602 price. As you would be using it at a more limited range, it would
effectively have a lower NF.

# 4200. Re: need world's simplest VFO

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-06 00:00:00 UTC
From: skipp@catbert.ucdavis.edu
Message-ID: <63tak1$h6q$1@mark.ucdavis.edu>
Source record: 89385

The world simplest VFO is a crystal with a method of variable pressure on
the quartz. An example is an older FT-243 case style with a threaded screw
hole in the center. A screw into the hole can be adjusted to vary the
pressure on the plate which is against the quartz. Some of the holder
internal spring tension is taken out also.
Those of you from the early HW-16 and other xtal xmiters might have also
used this method to move your tx freq around when that ever present rude
"big gun" parked righ along side your favorite rock frequency.
I even went one better and had a small knob that fit onto the screw for
ease of QSY. Carefull not to place to much pressure on the quartz.

You could also take the quartz out and sand it with some tooth paste,
comet cleanser or equiv to make big moves.

# 4201. TRADE: My IC-R7000 for your HP8640B?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-06 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <34622CCE.6460@pop.removethistomailme.net>
Source record: 89386

Kind of a long shot, but... anyone interested in swapping an HP8640B (civilian model with PLL stabilization) signal generator for an unblocked Icom IC-R7000 receiver?

The R7000 in question is in excellent condition, no scratches/smoke/problems, and tunes 25 MHz - 2 GHz with full 800 MHz coverage. It is complete with original box, manual, and RC-12 remote control option.

I recently picked up a new general-coverage receiver in another deal, and don't need the R7000 anymore. I do need to upgrade my old HP608D signal generator to something a little more modern, and would like to swap the R7000 for a clean, fully-functional 8640B, preferably (but not necessarily) one with the 002 frequency-doubler and/or 001 audio oscillator options. Really looking for civilian model 8640B only, not interested in 1/2-ton bright-yellow military model unless it is literally in brand new/unused condition.

Any takers?

>Can anyone tell me what this Heathkit power amp Model HA- 202 A is?

It's two meters, sold as a companion to the HW-202 and HW-2036. It's supposed to be 10 watts in, 40 watts out. I have one that I use with my 2036, and it makes about 30 watts across most of the band, being driven with 7 watts. Not a bad amp. Pretty dated, though.

>Whoa1 You just piqued my interest. A blank with third overtone output at 10
> MHz? Or 30 MHz? Perhaps I'm not asking the right questions of my suppliers.
>
>W4ZCB
The lowest acoustic loss into mounting etc comes from biconvex or plano
convex crystals that are 3rd or 5th overtone, loss in the quartz goes up
in proportion to frequency.
The first design employing this concept came from Bell Labs in the early
50s 5th overtone at 2.5 MHz ultimate Q limited by quartz 4.5M.
Advantage of these designs are that df due to surface loading changes
reduces if as the overall mass is greater. These units are very big
(500kHz fundemental) I designed a double ovened standard employing this
crystal in '67.
Reduced loss into mounting also means that mounting stress effects are
less.
The modern equivilent is the 3rd overtone SC cut at 10MHz Q is less due
to increased quartz loss (800000) but effect of mounting stress is
reduced by the double rotation. Surface effects are improved by better
processing.
The 16.384MHz standard that I sell is a 3rd overtone SC cut and performs
as well as the 2.5MHz design.

Just go ahead and use it and don't even think about the different impeadance. The only problem will be attaching connectors. A lot of that stuff won't take solder.

Should not be a problem for HF. I have used 75 ohm feed line several
times. Of corse I also use an older rig that has tube finals and has to
be tuned(gasp). I, personaly, would not use it for vhf but it would
probably be ok. The problem I have is geting connectors to solder to
it. If any one has a sugestion let me know.

I for one ended up with a 1000' spool of RG6 really cheap. I think the "standard" way of doing a connector for it would be to do a crimp-on F connector. They are readily available as RG6 is still a major standard in the world of Cable TV. You can get adapters from F to other common types of connectors (SO239, etc.) An alternative might be to use a PL259 with the UG(75?) reducer/adapter commonly used with RG8X. I think the OD on 8X and RG6 are about the same, and mechanically it should work.

> they are NOT some new, "wiz-bang" development

Nobody, including the author of the article in question, said they were
*new*. But "state of the art" is not a synonym for "new." I suggest
MMICs *are* state-of-the-art devices, inasmuch as they are in common use
*in the art*. Let's be clear: Are you saying that MMICs are obsolete
technology?

> and that a "wide-open"
> amp such as the article describes has some potentially serious draw-
> backs, which the article seemed to ignore ...

Read it again, particularly the sidebar. It's described as a simple,
easy preamp, *not* a high-performance preamp, and its problems when
presented with a strong out-of-band signal are noted. Hardly what I'd
call "ignoring" the drawbacks.

> Obviously ANY criticism of ANYTHING that the ARRL does meets with quick
> and certain spin-doctoring response from the loyal staff.

Obviously anything ARRL does meets with quick and certain spin-doctoring
(like claiming that QST was presenting MMICs as "new" when it did no
such thing) from those whose agenda it is to besmirch ARRL. If you don't

mind -- or even if you do -- I'll continue to set the record straight when you present a distorted or downright wrong picture of ARRL and its activities.

> Next, I
> suppose, the league will have counsel petition the FCC to make it a
> violation of Part 97 to utter any words criticizing the high and mighty
> ARRL???

Hey, Carl, *you're* the one up in arms because you're being criticized. I didn't say a word about your right to post your opinions; I only disagreed with the opinions you posted. And for the record, you are welcome to disagree with me and with ARRL as much as you want, on this forum and elsewhere. On the other hand, you attack me not only for the wrongheadedness (you think) of my opinion, but for my even expressing one. Who is the party trying to suppress dissenting opinions here? 'Tain't me, that's for sure.

The question about grinding xtals brings back a fond memory of a situation in Korea many years ago. I was a civilian TechRep assigned to 5th AF in Korea. We used RTTY for xmissions to HQ 5th AF in Tokyo. A new frequency was given to us for transmtting.. No Xtals to meet the requirement were available.

I had never ground a xtal before but decided to try with a xtal a bit lower than the required frequency. Tooth paste - nothing happened of any note. Dry cement - same thing. Then I noticed a Korean carpenter sharpening his plane on a small whet stone. I borrowed the whet stone, spit on it and ground away.

Ureka!! Now we can communicate with Tokyo!!

# 4229. 80/40m 2x BUZ21 SIPMOS Linear amplifier

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-07 00:00:00 UTC
From: la8ak@online.nospam.thanks
Message-ID: <3463a448.957892@news.online.no>
Source record: 89413

LA7MI mentioned he built a linear amplifier for 80m smd type QRP transceiver. It uses BC547 emitter follower to base of BD135 (1W epoxy - equiv. to 2N3053/2N1711/BFY51) with tapped LC collector circuit to drive 2x BUZ21 low price Sipmos transistors in push-pull circuit. +24V supply voltage
With 0dBm /1mW drive the output is 60W on 80m and 50W on 40m.

# 4236. Help with Relays Please...

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-08 00:00:00 UTC
From: Bob Snyder <rsnyder@pcisys.net>
Message-ID: <01bcec02$95db53c0$6a664ccf@rocky>
Source record: 89320

I am working on a remote antenna switch project and was wondering about the RF going through the relay contacts.

What rating do I need to look for to handle 1k watt of RF? One relay I am looking at is a 3PDT rated at 20A @ 120VAC. I would use all three contacts bridged together to increase the capacity.

Another relay is a DPDT and is rated "Max. Curr. @28VDC 240VAC - 30A. I guess I don't know enough about electronics to understand why 30A @ 28VDC would be the same as 30A @ 240VAC. At 28VDC I figure each pole should be able to handle 840 watts for a total capacity of 1680 when bridging both poles together. Is that right? At 240VAC I figure (but don't believe) that each pole should be able to handle 7200 watts.

Any help on this would be appreciated.

Hi all,

My friend has an ADI 146 and the PA block appears to have blown. I have a BGY 35 block and would like him to have it to fit in replacement. The problem is he can find any information about the blown block or its pin out. He's not sure of the model number but he assures me it's made by Toshiba. I'm hoping he will get me the model number in the next few days but in the meantime does anyone know about these radios and the PA block fitted?

Thanks in advance for your help.

[snip]

Last time I needed that transformer, I rewound one. It's faster
than surfing the internet, and easier than dealing with the abuse
served up here.

This is the real reason you need old old TV sets in your junk box....
but if you had to, you might be able to rewind a battery charger
or remove the windings from one, or do the boost/buck trick with
another transformer.

Bob, the ratings for relay contacts are based on the amount of current
that they can *make or break* without welding. In other words, the spec
is for hot switching. Since you shouldn't be hot switching the relay, this
spec doesn't mean much to you. What you are interested in is the sustain
current of the relay. That's pretty much independent of voltage up to the
point where you get arcing to other contacts or the relay frame.

At the 1.5 kW level, you need a sustain current capability of about
3.33 amps for a 450 ohm system, or about 5.48 amps in a 50 ohm
system. So the relay doesn't have to be that big at all.

You will have a hard time getting even three 813's to tune up on 10m due
to
the high plate capacitance, if you are going grounded-grid. With four,
maybe even 15m would be difficult.

I tried this years ago, and somehow got 3 tubes working on 10m by having
a
switch that disconnected the plate tuning cap all-together. Then I
adjusted the 10m coil tap to resonate with no tuning cap- just the plate
capacitances.

Rob.

Hi Chris,

Having built one of these a few years ago I can tell you that you may
have trouble getting it to tune on 20 meters with four in the output!
The minimum capacity of your tune cap can play a role on 20 meters.
However the solution is at hand: SERIES tuning.

Hello,
This is the first time I have ever replied to a newsnet, so here goes.
Rich,
There are some very fine supplies out there for pennies per pound. The
trick is this buy 3 5 volt supplies and run them in series for 15 volts.
Each supply can usually be readjusted. Usual ranges that I have seen are
4-6 volts. So readjust each of them to your requirements.
The above discussion adresses the types of supplies that you see at
hamfests that are floating output.

True PC power supplies may have a groud connection in them on the output. If this is true measured with an ohm meter on the black lead to ground of its chassis, you would want to remove that connection so that you can stack the supplies.
Hope this helps out. I have collected some incredible supplies over the years and could never understand why Hams did not buy the incredible power supplies that were at there feet for 2 bucks a pop, instead they by some silly supply at 150-200 dollars that consists of a LM 723 regulator. Not a bad supply, but thats a 30 dollar solution.
Have fun and save some supplies.
Thanks Paul.

Not always monsters 3rd overtone AT cut in a resistance weld holder at
10MHz could be $30 if it was a standard design best to ask a friendly
LOCAL crystal maker what staandard design he produces in quantity for an
ovened oscillator manufacturer. SC designs are on the increase when
used a maintaining circuit that supresses the nearby unwanted mode is
required.
Glad you asked:) I happen to have 16.384MHz OCXOs (2^14 KHZ) bought on
the surplus market that employ 16.384MHz third overtone SC cut crystals
I sell these OCXOs at $90 they are almost as stable as rubidium
frequency standards.

The Radio Shack version works here on the east coast, although it seemed
to take about 2 days to find the WWVB signal. However, comparing
the clock to either CHU, WWV or some other supposedly accurate
source, the clock is within the accuracy claimed. About my only
complaint is that I can't set 24 hour time on it.

>And good source of these diodes? I need about 60 of them.
>TIA
>Tony

Hi Tony. You can search for these and other Motorola devices starting at http://motserv.indirect.com/cgi-bin/search. It looks like the '3700 has much better reverse voltage tolerance --- 200 Vdc vs. only 20 Vdc for the '3404 -- but that may not mean much in your application.

Frequency may be important: both of these diodes are intended for VHF. I have found that the MPN3404 is no better than a 1N914 when used as a switch below about 10 MHz so I'd guess its recovery time is about 100 ns. The MPN3700 has a 300 ns recovery time and probably works better in the HF region.

Newark has both of these:
08T MPN3700 $1.07 (1-99)
08T MPN3404 $1.04 (1-99)

Hope this helps some

RG-6 style cables are excellent, with low loss, especially the quad shield variety. Make sure you get really good connectors and rubber boots for out door use.

One caution. Since the RG-6 cables are not intended for transmitter use, you will probably be able to find out how much power they can handle. You should have no problems with a 100 watt transmitter as long as your SWR is not too high (3 to 1 or better).

>but not cellular phones.. any advice?

That's pretty much all the FRS radios are designed to do.
They're designed so you can't use an external antenna or
amplifier with them. If you and your buddy are on high points
with a long common line of sight, you can sometimes get much
better than 2 miles, but in typical suburbia, 2 miles is about the
limit. In some terrain it will be much less than that.

You might look at the GMRS radios instead. The HTs run
about 5 watts and can deliver a 2 to 10 mile range (depending
on terrain), and can be used through a GMRS repeater station
to give up to about 60 mile range (again depends on terrain).

You usually have to pay to use a GMRS repeater, but it
usually doesn't cost much. Check locally to see what's
available. You can also use mobile radios in GMRS, they're
higher power and give more range. You can add external
antennas to either type to improve range somewhat.

Of course you can use regular CBs too. That tends to be a
madhouse in some areas, though, and might not suit your
needs. But if you can find a clear channel, you can often
get a range of 20 miles or so between *legal* mobiles. Some
people run huge illegal amps and get somewhat better range,
but don't do that. You impact everyone else trying to use
CB. When the channel isn't clear (which is often) you won't
get much range at all.

If your communications is "just for fun", then consider getting
an amateur radio license. You can then choose equipment and
frequencies which can deliver practically any range you like
from very local to worldwide. But amateur radio isn't intended
for business use. The other services permit business use. And
you do have to pass licensing exams to get an amateur license.

The Tech exam isn't hard, and lets you do a lot. The exams
for higher classes are progressively harder, and allow you

access to HF, which has worldwide reach. You need to know Morse Code for the latter licenses (for now at least, that's the subject of pending regulatory reconsideration at the international level), Tech does not require it. Amateurs have many repeater systems which you can usually use for free (or for joining the repeater club) as a Tech, and these, like the fee paid GMRS repeaters, can give you a range of 60 miles or so with handheld radios. (And there are lots more amateur radio repeaters than GMRS repeaters, so you're much less likely to be where you are out of range of a repeater you can use.)

If your use is business related, one alternative to cellular you might want to consider is ESMR. Nextel offers this (as do some others). What you get with ESMR is a super-trunked 2 way radio, an alpha pager, and a cellphone-like capability all in one package. The only per minute charge you incur is when you make a cellphone-like call.

As long as you are just talking to your call group, its like ordinary 2 way radio. The range of the system can be very good. For example, if one member of your talk group is in Atlanta, another can be in Birmingham. You can chat back and forth just as if you were both local, and there is no long distance charge or per minute charge. This service costs about $40 a month. (Considering the avoidance of per minute charges, this is a good deal better than cellular if you talk with the same group of people most of the time.)

Like cellular, however, ESMR requires that you be in range of the network. If you're in the back woods somewhere, you won't be able to talk directly unit to unit. For that sort of thing, you need FRS, GMRS, CB, or amateur radio. (You could also get an itnerant business band license, but the range wouldn't be much better than with FRS or simplex GMRS, and your use is supposed to be strictly job site related, IE it isn't intended for casual chatting.)

That's a bit of a problem, Dave. The second harmonic of the 10m
rig falls near the 6m band and is hard to suppress coming out of the
transverter mixer (which is, of course, a great harmonic generator).
That can cause interference to channel 2 TV. That's why Ten-Tec
chose 20m as the input frequency.

A easy way to use any impedance coax with 50 ohm transmitters and antennas
is to cut the transmission line to be an electrical (or multiple) half
wave-length. This is easly found by l=(468/f)*VF where f= freq in Mhz,
VF=velocity factor of the coax and l= the lenght of a electrical wavelength.
I use Belden 9213 (75ohm .3db loss at 30mhz per 100') during my portable
contests efforts using this trick. Many hams use CATV 1/2 & 3/4" hardline
for long (>500') using this same method!

Hi
I got few douzens transistors from LA3VW today they are ITP2535
BSN304A BSP304A, any idea what they are ? need only simple details,
connections, will check more closely from possible site, but at the
moment acrobat acrobe 3.01 fails to operate on this 486DLC

I am trying to straighten out a circuit for an Old Timer friend. He built it over a year ago and hasn't been able to get it to work. It is an Audio to Push to Talk circuit that appeared in 73 Magazine in January of 95. There seems to be a problem with a change in the size of R5 and R8. There is an update in the May 95 issue but I don't have any issues past that and it doesn't mention those resistors. Has anyone successfully built that project? Any help appreciated.

Also, if anyone has a copy of the June, 1995 issue of 73 magazine and could look in it and see if there is an "update" talking about the above mentioned article, I'd appreciate knowing what it said. I don't have that particular issue. Thanks.

Gentlemen,

Sorry that I didn't see the original post and can only respond to the response.

Use of 75 ohm cable with 50 ohm equipment is not as strange as it may seem.

The impedance seen by your transmitter (or tuner, if you are using a tuner) is not the impedance of the cable - it's the impedance of the load at the far end of the cable, transformed. The transformation is a function of the frequency, characteristic impedance of the line, and the length of the line.

For example, assume that the antenna presents a complex impedance of 75+j60 ( 109 ohms magnitude). Further, assume a 75 ohm cable and a

length of cable of 0.15 wavelength. For example, at a frequency of 3.8 MHz the cable would be physically 29.13 ft. This is from the equation relating the number of wavelengths (N), length (L), velociy factor(VF) and frequency(f). (I used VF=.75 for RG-6)

N = L * f / (984 * VF). (VF=.75)

If you now go to the Smith Chart with these values (0.15 wavelength, 75 ohm line, and the antenna impedance above, you will see that at the transmitter the impedance will be seen as 50 ohms. (50 + j0). So, there's an example of how the 75 ohm line can be used effectively.

My general advice is to become familiar with transmission line theory and the Smith Chart. You then have to put connectors on various lengths of cable and be prepared to use them where needed. It often turns out that a specific length of some strange characteristic impedance is just what you need in a given situation.

Good Luck,
Bob

<<<***VERY MUCH SNIPPING***>>>

Am I to understand that there is a need for a tutorial series on
basic solid state RF design, starting with the raw basics??

Don't think that your observations are limited to hobby books
and periodicals. Many times I have found that professional books,
costing near $100 or more, will leave the reader totally in the dark
as to where it all came from. The result is that I have accumulated
a substantial library of books discarded from libraries (institutional
as well as private) becasue they were considered "obsolete."

But this is where the fundamentals are contained that develop
into the "new" technology. And some of this "new" stuff, quite
frankly, sucks. 8{O If you go back 40 years or more, you are amazed at
what people were doing without being able to use 20-30 active devices
in a single function. We're talking tubes here.

This philosophy carried into the early days of transistor
circuit design, but was then overrun with the integrated circuit,
which although they made things simpler, they compounded certain
problems like distortion and noise by the shear quantity of devices
being used. Absolutely not a suitable solution for RF design prob-
lems.

I'm glad to see that others have discovered the value of the
older handbooks. But let's not overlook the fact that society is, in
general, "dumbing down" just about everything. Most of the newer
engineers I see don't know how to bias a simple one-transistor ampli-
fier. But they can make the background colour of the screen change.

>>That 4 dB will do a whole lot of good.

>>W4ZCB

From what I understand, N.I.S.T., successor to Nat. Bureau of Standards, got some Navy surplus AN/FRT-88 or 89 transmitters (I'm not sure of the number) for free ($1 to make it official) to replace their aging WWV equipment. As a direct swap from one agency of the government to another, N.I.S.T. saved alot of tax dollars by doing this. The Navy had excessed these units and would have likely only received pennies on the dollar for scrap. It just so happens that the replacement transmitters run 40 KW. The old transmitters were not replaced just for the 4 dB. The new transmitters are also more efficient since they can run upper of lower sideband with carrier injection (to simulate an AM signal) and reduce power consumed in one sideband.

Here's my review of said book, extracted from this months issue of the
European Microwave News:

THE NEW RSGB VHF/UHF MANUAL
---
A Review By Simon Lewis GM4PLM

The RSGB have recently released the latest edition of the VHF/UHF manual
and I decided to pick up a copy at the Leicester rally to review for EMN
readers.

The last edition was printed in 1983 and was pretty well out of date
before it even made it to press. This latest edition is fairly up to
date but the latest format has turned this book into a form of
'beginners guide' to VHF/UHF operating and has lost alot of its sparkle
in doing so. Having said that it is up to date, there are some glaring
omissions! No detail or discussion of modern semiconductor devices such
as GaAsfets or MMIC's, outside of the equipment examples, and the only
detailed technical semiconductor discussion seems to look at high power
semiconductor amplifiers.

The old style manual is gone and the filter, components and dedicated
sections are gone. In comes a combined receiver, transmitter and
transceiver chapter. The equipment details in this chapter either
originate from VHF Communications magazine and are by German authors or
are ancient designs from the previous edition.

Surely someone has built 144 Mhz amplifiers in the UK which use
something better than a single 4CX250B ? The only glimmer of hope comes
with a US designed 432 Mhz 3CX800!

The microwave chapter has been removed (citing the Microwave Handbooks as the reason) but has briefly touched on 23cms with a 144 Mhz - 23cms transverter by DB6NT (not for beginners from UK builders experience) and a few loop yagi details. A single 2C39 valve amplifier is shown in the now ancient and over published G4PMK/G3SEK design (Sorry Roger/Ian!).

Chapters are written by contributors but I can honestly say that some of the contributors are not well known figures in VHF/UHF DX'ing and that the inclusion of some chapters is questionable and others a complete waste of time. I am pretty certain AMSAT UK could have come up with more than 1 page of text, which tells an interested newcomer to satellites very little, other than where to send his/her money for AMSAT membership. Does 1 page actually constitute a chapter?

Chapters included in the book:

Introduction to VHF/UHF Dave Stockton GM4ZNX
Getting Started Dick Pascoe G0BPS
Propagation Ray Flavell G3LTP
Receivers, Transmitters and Transceivers Mike Wooding G6IQM,
Steve
Thompson G8GSQ, Geoff
Pike GI0GDP.
Antennas and Transmission Lines Peter Swallow G8EZE.
EMC Dave Lauder G0SNO
Data Modes Chris Lorek G4HCL
Amateur Television Brian Kelly GW6BWX
Satellite Communications Ron Broadbent G3AAJ
Repeaters Geoff Dover G4AFJ
Test Equipment, methods and Accessories Clive Smith G4FZH
General Data Dick Biddulph G8DPS
Fitting Coaxial Connectors Roger Blackwell G4PMK

Overall the book is disappointing and certainly not worth the 20 UKP asking price. The content is weak and occasionally questionable and indeed in the case of the satellite 'chapter' (!) laughable. The equipment designs are either old and previously well published, or are new and of non-UK origin. Surely someone in the UK has built other designs? I also question the use of the VHF Comms designs. The designs are well documented and includes PCB layouts but they cannot be easily reproduced as they also have the component overlays on them and they are not clear. Is this a case of protecting their designs? I was also concerned to see the transverter designs using 3 MMIC amplifiers in series and then a complete lack of filtering before the antenna! Hmmmmm!

So for anyone thinking about buying the new VHF/UHF manual, don't bother! Either save your 20 pounds or go and buy the VHF/UHF DX Book instead!

Simon Lewis GM4PLM

---

Enough said!

>Hi Tony. You can search for these and other Motorola devices starting at
http://motserv.indirect.com/cgi-bin/search. It looks like the '3700 has much
better reverse voltage tolerance --- 200 Vdc vs. only 20 Vdc for the '3404 --
but that may not mean much in your application.
>
>Frequency may be important: both of these diodes are intended for VHF. I have
found that the MPN3404 is no better than a 1N914 when used as a switch below
about 10 MHz so I'd guess its recovery time is about 100 ns. The MPN3700 has
a 300 ns recovery time and probably works better in the HF region.

Newark has both of these:
08T MPN3700 $1.07 (1-99)
08T MPN3404 $1.04 (1-99)

Hope this helps some
Bob Moore KV1V

Gee. I don't think so. I know that the recovery time is not specified for the
04, and I was concerned about intermod I was experiencing on an old Cubic 103
that uses them for front end switching. (and just about everything else too!)
The Ip3 ultimately turned out to be the Taiwan powdered iron transformers in
the front end RF filter. (+21) I tested the 3404's at 1.8 MHz and they are
clean to about +35, the upper limit of my test gear.

Tony, if you wind up buying them from Newark, and you need 60 of them, I'd take
the other 30-40 to get us to the next price break.
(3404's)

You would be better off with a single 3-500Z and have the same plate dissipation as four 813's. The interlectrode capacitance would present major problems on 15 and 10 meters to the point where you might not be able to achieve an adequate loaded pi net Q. If your need is for 160, 80 or 40 meters only maybe that would be the limit for a 4 tube amp design.

75 Ohm cable is pretty much okay at HF, although the impedence mismatch may make your transmitter back down on power. All you need to do is put in a tuner and tune out the mismatch and you should be all set.
There may be antenna considerations as far as baluns go but I'm not too sure about them so I'm not going to tread there. Look in the antenna handbook or the Amateur Radio handbook and they'll tell you what you need to know.

Hi,

It is probably worth considering using one larger and newer tube type.

At 125 watts dissipation each, the 813's may not be the one of the
better choices, considering the problems of paralleling that many.

I assume you want to use class C. It may be worth considering tubes
that would run AB2, such as a pair of 4CX250's, etc.

I encourage you to explore alternatives to the quad 813's.

Do not reply to the address in the header. Instead, remove the
one-two from the following address:

OK, I've gotta interject some commentary into this thread.

What really floors me is not any "dumbing down", perceived or real, but the horrific organization of intra-chapter content in some of the newer Handbooks.

As a follow-up to a post of mine in another newsgroup describing a homebrew receiver project, one fellow recently sent me e-mail asking for good references on the basic principles of superhet receivers. He said he had access to a late-model ARRL Handbook, so I thought "great, I'll look through the book and recommend some chapters on basic receiver theory to go over." He mentioned that he'd leafed through the Handbook and found it rather "intimidating," a remark which I sort of blew off at the time. Hell, how intimidating can the Handbook be? The older editions I once studied could get pretty involved at times, but all you had to do was start on page 1 of the chapter of interest and stick with the program, and eventually you'd get the insight/information you were after.

So I pick up my '95 handbook, the most recent edition I own, and start leafing through chapter 17, "Receivers, Transmitters, Transceivers, and Projects," intending to recommend it to the guy who sent me the mail. But... whoa. The first page's headings look like "Voltage Gain", "Actual Power Gain", "Available Power," "Available Power Gain," "Transducer Power Gain," "Transformation Methods," "Noise Factor of a Passive Device"...

HOLY COW, PEOPLE. This material is WORSE THAN USELESS as the lead-off text in a chapter on receivers. There is absolutely no context for the beginner to grab hold of, no sense of relevance or practical application to any of this stuff unless you are already well-versed in the theory and operation of a radio receiving system.

Make no mistake, the content is there. The chapter in question was written by Bill Sabin and it's great stuff, for those already acquainted with receiver elements at a structural (block) level. It is the height of absurdity to claim, as some on the newsgroup have, that this is "dumbed down" material. Don, go compare chapter 17 of the '95 Handbook to, say, chapter 5 of the 1966 edition, and then come back here and tell me with a straight face that you think the '95 Handbook has been "dumbed down." (Note that what you perceive as "dumbing down", or loss of meaningful content, may actually represent material that's been moved out of the Handbook into more specialized publications like the UHF/Microwave Experimenter's Handbook and ARRL Antenna Book, and greatly expanded upon at the same time.)

Now that I've deliberately tried to look at a modern ARRL Handbook from a beginner's perspective, I really have to come down hard on the organization of the material in this chapter -- the Handbook editors can, and have, done better. There is a reason why I initially pointed the student who wrote me towards the ARRL Handbook, and not the latest $100 treatise by Ulrich Rohde or some generic recycled unedited opus from TAB Books. To me, the ARRL Handbook always represented the ideal compromise between theory and practice. And it still does, to a great extent. But somebody had better put some effort into accessibility.

I mean, what *possesses* an author to present a "typical block diagram of an image-cancelling direct conversion receiver" (with 15 stages) BEFORE finally getting around to showing the block diagram of the canonical superhet (complete with trigonometric mixer-function equations, no less) on the NEXT page, 22 pages into the chapter? Used to be that the first few pages in a book on receivers would lead into a description of the 'All-American Five.' Nowadays, it seems we expect beginners to be able to field-strip a Collins 95S-1 by the time they've gone 20 pages into the chapter. :-)

Anyway, enough ranting!

>
>Enrique, EA1FQ
>e-mail: ea1fq@mundivia.es

I believe the idea is to split the input ot output capacittance of the
filter into two capacitors. This assumes that the filter is the type
to have a shunt capacitance at it's input or output.

Assume that the top capacitor (the one that goes from the filter to
the new output terminal)is Ctop and the one from the output terminal
to ground is Cbottom,
The total capcitance is found using the formula for series
capacitance:
1/Ctop +1/Cbottom=1/Ctotal

i.e. Ctotal = Ctop * Cbottom/(Ctop+Cbottom)

The voltage ratio is:

R=Ctop/(Ctop+Cbottom)

The impedance ratio is a step down of 1/R^2 (R squared) at the output
or a step up ratio of 1/R^2 at the input.

For example, if you want to use a filter designed for 100 ohms in a 50
ohm system, R^2 = 0.5 and R = 0.707.

If the input capacitance was 100 pf, Cbottom would be 141.4 pf and
Ctop would be 341.3 pf.

If the output ca[acitance was also 100 pf the top and bottom
capacitors would be the same as on the input.

Replacing the input and output capacitors and connecting to the
junction of the two capacitors (at each end) would then give you a
filter matched to 50 oms, even though it was designed for 100 ohms.

Absolutely right John. I keep the 96 version check out of the library continuosly, trying to learn RF concepts after 20 years of digital experience. It's like Unix Man Pages. Every one of them assumes you've read every other page! Talking to old RF guys is the same. At least the book doesn't get bored when you access it over and over and over, trying to grasp an idea. The BIGGEST problem is there are no SIMPLE examples of circuits that the no code tech can use!

> To me, the ARRL Handbook always represented the ideal
> compromise between theory and practice. And it still does, to a great

I believe you have identified the primary reason no code techs don't stay with the hobby actively. They don't _want_ to be component consumers (which folks here accuse them of being). So when they start asking questions, they get pointed to "The Handbook", and then get lost.

> Anyway, enough ranting!

No! Let's rant about this some more! I can even offer _specific_ topics!

I had to go look for myself just now. My newest Handbook is a '91.

It's extraordinary! The elementary here's-how-a-typical-radio-works stuff is buried amid detailed descriptions of dielectric constants, thermal noise, etc.

I suppose I don't normally expect a handbook also to be a primer. But this one probably should have more primer-type material as the intro to each chapter.

Becoming a new Ham suddenly looks more daunting, and learning code is not the worst part of it.

Thanks for a well-thought-out, well worded posting.

> indeed be borne by you and I.

>W4ZCB

The upgrade that I was referring to was WWV HF operations which are being upgraded with the Navy transmitters. Due to severe budgets constraints, NIST has to work with what ever they can scrounge. A free transmitter will buy alot of electrical power. As far as the WWVB upgrade, the extra field strength is needed in areas of CONUS where the WWVB signal is marginal. Using ground wave the calculations for field intensity being rather straight forward, the field intensity is increased by a factor of 1.41 X field strength as calculated by the cosine law. A sky wave HF model for propagation is not valid at 60 Khz. A 4 dB increase at 60 Khz IS a significant increase. Comparisons to a free space model (used above 30 Mhz) are even less valid. The main factor besides transmitted power that effects the received field strength for a ground wave signal is soil conductivity. Since they can't control that and most LF antennas don't have much gain, they most practical and cost effective way to get more E field is to raise power.

I finally got around to building my 142 to 432 MHz
transverter--its a lot more difficult than most people
think to get all the spurs filtered out--there are
some nasty ones just 6 MHz away. I ended up using
a rather large interdigital filter out of machined
aluminum--the cover made a nice mounting plate for
the rest of the transverter... Seemed a lot easier
than trying to couple cavity resonators together.

I found an ERA-4/6 could drive the SAU-4 to 10 watts
output with the IMD down 30 dB relative to either tone.

: info would be helpful.

(I trimmed the followup-to line to just rec.radio.amateur.antenna...seems like this doesn't need to be in 7 different groups!)

I agree strongly with the response that mentioned that a 75 ohm cable can be used to transform a possible antenna impedance to 50 ohms...and the key is knowing what impedance your antenna is, and using a chart or formulas to find out what impedance your rig, thru the coax, will actually see. But for one very practical use on HF, you can see that 75 ohm line may give results no worse than 50 ohm line: if you feed a dipole that's up high enough to have a nominal 75 ohm resonant feedpoint impedance, then that 75 ohm line will deliver a 75 ohm load to the transmitter, a 1.5:1 SWR. If you used 50 ohm line, your 75 ohm load still yield a 1.5:1 SWR, at least at the load end of the line, and it won't be significantly better at the transmitter if the line is low loss. In either case, to get to 1:1, you need some impedance transformation, like a tuner, and you might just as well use that RG-6, which will have loss nearly as low as RG-8 solid dielectric line. (I'd expect nearly any transmitter with a tuned output stage, like the TS520 series, to handle 75 ohms just fine; and transmitters like the TS440S with the optional built-in autotuner should also be able to handle that 1.5:1 without any trouble.)

There's RG-6/U, and there's RG-6-type (many different varieties!)...the graph I have of safe power handling for RG-6/U shows 1kW at 14MHz and below, falling to about 300 watts at 150MHz and over 175 watts at 450MHz. The graph is based on a maximum ambient temp of 40C, and line in free air, and 1:1 SWR.

> where would I get a hold of them?

Tandy's new mail order outfit Tech America (www.techam.com) has kits
from Rainbow and Velleman. There's also a guy who ran a Hong Kong
outfit, DIYKit (?) that was posting to the electronics groups a
while back, they have a web site, too. Also check out the ads section
in Electronics Now, Popular Electronics (look for the fat issues that
have the Electronics Shopper section) or Nuts & Volts magazines. Often
one of the surplus shops or hobby oriented distributors will have
some of these lines in their catalog (JDR Microdevices sells Ramsey,
and Jameco has some).

Hi Ian,

I was disappointed to see your design 'yet again'! (as good as it was at
the time!)

I am not sure what the RSGB have done with this version of the book, it
seems to have gone from a comprehensive 'bits and pieces' book to a
beginners guide.

As its been published yet again this leads me to two possible
conclusions:

1. That no new designs or equipment has been produced since last
issue.

2. People are hacked off with the RSGB and its publications and
cannot be bothered to write and get them published!

I hope that its not case 1 and people just cannot be bothered to build,
but from what I have seen in the EMN and my dealings with 'real'
microwave operators and builders is that the construction world is very
active and people are building their own gear.

I am sorry if you thought I was being 'negative' about your design. Far
from it, but I thought they could have come up with something a little
newer. Strange selection of articles though? Included a valve amp for
23cm but nothing solid state to accompany the transverter, and a

transverter that is anything but easy to build. Ask G4DDK!

Hello everyone,
I have a 350 Hz CW filter for the Yaesu FT-707.
I would like to swap it for a AM 6 Khz filter. If anyone is interrested or
has the AM filter for sale, please e-mail me with a proposal.
Thanks to all.

Source record: 89290

Hello. This might be a _little_ off topic. It does
involve some homebrewing.

I just bought my nephew a pair of cheap 49MHz FM walkie-talkies.
He lives on a large farm, and these things barely make it from
my kitchen to the living room, and those rooms are next to each
other! So my question is, is there an easy way to get a little
more power out of these? Replace a final transistor with one
of a little higher value, maybe? With a heat sink? Or might
this unit already be capable of higher power, but is limited
internally to something, like older CB's used to be? It only
has 4 transisistors. Which one may be the final? One is
located near the antenna lead, but does not look to be connected
to it. It seems to go to the one and only adjustable coil type
thing. This transistor says 9014 on one line, C: 624 on the second.
The other is right next to the coil, and it says S9018 on one line,
G 320 on the second. They are both (all 4 actually) normal, small
plastic type cases. (TO-226, or TO-92 ?? )

Thanks so much for any help you can give me.

Please reply via email if possible. Thanks.

The last edition was printed in 1983 and was pretty well out of date before it even made it to press. This latest edition is fairly up to date but the latest format has turned this book into a form of 'beginners guide' to VHF/UHF operating and has lost alot of its sparkle in doing so. Having said that it is up to date, there are some glaring omissions! No detail or discussion of modern semiconductor devices such as GaAsfets or MMIC's, outside of the equipment examples, and the only detailed technical semiconductor discussion seems to look at high power semiconductor amplifiers.

Oh, dear! That's exactly what i was trying to avoid. *Sigh*

The old style manual is gone and the filter, components and dedicated sections are gone. In comes a combined receiver, transmitter and transceiver chapter. The equipment details in this chapter either originate from VHF Communications magazine and are by German authors or are ancient designs from the previous edition.

It sounds like they're going the same direction as the ARRL... I hope the folks on the other side of the pond will make lots of noise about this!

The "handbook" concept suffers from one major problem: It doesn't know who the reader is. It has to assume that one already knows everything needed to understand the topic under discussion.

The problem is similar to that of writing an encyclopedia entry. You can either dumb it down or make it extremely complex. Either way, you're likely to lose readers.

What many beginning folks are lamenting is the lack of simple receiver design concepts in a book that progressively takes them through a few projects. Suggesting they read the Handbook is like feeding somebody breakfast lunch and dinner all at once.

Further, I've noted that some replies here have suggested the handbook is like reading man-pages. Having read a good deal of both, I'll suggest one clear difference. You can easily experiment with the command (or subroutine call, or file structure, etc.) from a man-page. It's not so easy to "throw together some junk" and experiment with the projects in the handbook. In other words, you can (and do) test the man page entries. You can't do the same with a chapter of the Handbook.

We need a tutorial RF designer's book. I have my favorites, and they all have their strong points. The problem is that none of the chapters in any of these books are really focused toward the goal of understanding how a radio is designed and built. Remember those books

that Radio Shack sells by Forrest Mimms? He has the right idea. Now if only we can carry that concept a bit further with common parts...

You know, someone could make a good living just from selling a tutorial of this sort and the parts to go with it. Something like what NRI used to do... only better.

Hello Ted!
Me thinks thou hast missed the boat by about 12+ years!
I used to live in Vineland, and when Cable-TV was coming in hot and
furious, I decided to ride around the area, check for TV towers by a
house that had the familiar Cable line going into it, and 'offer' to
dismantle their obsolete tower for them for no charge! I believe I
acquired over 30 towers like that! Which I then sold to people up here
in No. Jersey. Around the Middlesex/Union Counties areas.
Yepper.....I made big bucks those 2 years!
Try doing what I did. There may be some left.
Regards,
Brian

# 4322. wood construction help?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-10 00:00:00 UTC
From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Message-ID: <Pine.HPP.3.96.971110093825.24358A-100000@holmes.ece.orst.edu>
Source record: 89299

I am working on re-building an old crystal controlled, CW tube transmitter my grandfather and I started a number of years ago. I would like to build this transmitter up on wood, but I'm not familiar with the construction techniques (I missed that era of radio by quite a few years ;)

I have several questions. How do you mount the tube sockets? In a sheet metal chasis, it's pretty straight forward so the tube is above the metal plane and the pins below; I'm not sure how that works with wood.

How do you mount the front panel controls? My thought is to use the same heavier wood I plan for the base (1/2"), and to router out "tracks" behind the panel controls to make a thinner mounting area.

How do you create a ground? In the original metal chasis, this was no problem... the chasis made short ground leads simple and straightforward. I have thought about putting a piece of copper on top of the wood base, or possibly running several copper strips on the base and connecting them together as my ground.

Any suggestions to attractively mount the tubes? I didn't pay a lot of attention to this project when I was a kid, but now I am impressed by the beautiful simplicity of the tubes and would like to mount them in a 'show off" position.

TIA.

# 4324. help re: typ 5633 output impedance

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-10 00:00:00 UTC
From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Message-ID: <Pine.HPP.3.96.971110093147.23826A-100000@holmes.ece.orst.edu>
Source record: 89301

I am working on an old CW, crystal controlled tube transmitter that my grandfather and I started quite a few years ago. A 12BY7A is used in the oscillator/driver section to drive a 5633 pentode power amplifier section. (I think that number is correct). My question is, what is the typical output impedance of this tube? I am using a low pass PI network to match it to an antenna, and would like to match it to approximately 50 ohms.

The PI network consists of variable shunt capacitors at the input and output, and a tapped coil (tapped for 20, 40, and 80 meters).

Any help you can give me would be appreciated. TIA.

Message-ID: <647hnm$4pp$1@news.cadence.com>
Source record: 89302

I recently began scrounging parts for a high/medium/low voltage supply to power flea market tybe radio (Boatanchor) acquisitions. I found a pair of good looking 6.3 VAC @ 10 amp filament transformers. The promary and secondary were clearly marked. The primary with 0-110-115-125 on pins 1,2,3 and4. I connected 110vac between 1 and 4....the transformers (both) overheated and would have smoked were it not for the fact they were potted. What did I do wrong? Were these transformers bad in some way? The secondary was not connected in any way. These were OLD transformers is it possible the potting had gone bad?

The Radio Shack unit also works for me in the SF Bay Area CA. It doesn't seem to be able to acquire a signal whenever I'm around but stays synced up OK. I live in RFI hell, however, so it's probably getting a good signal during the day when everyone is at work, away from their cheapo light dimmmers and un-FCC-certified computers. Yes the extra 4 db will help.

As the previous poster said, the unit works fine except you cannot set it to display UTC or 24-hr time.

: my kitchen to the living room, and those rooms are next to each
: other! So my question is, is there an easy way to get a little
: more power out of these?

They should do Much Better than you've described!! Are you sure
they're crystalled for the same frequency?
Maybe you have some horrendous nearby interference that is severly
desensing the units.

I use a pair to 'detect' 6 meter openings. A vox unit mounted on
the 6 meter rig's speaker and a walk-around unit with squelch.
Both with short (~~16") whip antennas. I know it works Real Well
around 100 yards -- used it at that distance on Field Day to
keep tabs on the 6 meter station between openings.
The only drawback is the Phone Sex QRM from a cordless phone two
blocks away!! <BG>

I'm making some assumptions, but were these fundamental AT-cut crystals
that you reground for use on 2 metres by operating it on an overtone?

Assuming you wanted something to operate on 146MHz on it's 5th (or 7th?)
overtone, what fundamental frequency xtals would you look for as suitable
candidates?

> The ARRL handbook has had it in there for years..

True, but not what he asked.

You can make Cans, Helicals, or Coax-stubs. Helicals are typically
broader band than the other two, depends what your purpose is.

For Coax-stubs, see both of the following; the first also covers 6m cans:
http://www.dallas.net/~jvpoll/dup6m/dup6m.html
http://www.qth.com/topten/stubs.htm

The ARRL UHF/VHF projects book (I forget exact title) has helicals
if the handbook doesn't. Toko 2m helicals can also be ordered from
Digikey for not too much money.

Gary Coffman (ke4zv@bellsouth.net) wrote:

(about a remote antenna-switching relay:)

: At the 1.5 kW level, you need a sustain current capability of about
: 3.33 amps for a 450 ohm system, or about 5.48 amps in a 50 ohm
: system. So the relay doesn't have to be that big at all.

(Oops, Gary, I think you forgot the sqrt on that 3.33 ... I get
sqrt(1500/450) = 1.82 amps RMS.)

But...beware of voltage! 1.5kW at 450 ohms is about 1200 volts peak
(821 volts RMS). And...if the antenna impedance really is higher
than that, like a full-wave center fed dipole at maybe 2000 ohms,
the voltage would be twice that for that power level. If an arc
gets started it only needs a small voltage to keep going. Antenna
switches and relays that work in systems where there may be high
impedances usually have pretty wide contact spacing, from what I've
seen...or operate in vacuum. If in air, they also usually have
nicely rounded corners. A point of comparison is air-variable
capacitors, which at the few-kilovolt level have fairly wide
spacing and rounded edges on the plates.

> and operation of a radio receiving system.

Absolutely right John. I keep the 96 version check out of the library
continuosly, trying to learn RF concepts after 20 years of digital experience.
[geosynq@trader.com]

Same story here; i used to say "I only hack hardware out of self-defense."
(Nevermind that i could resurrect machines that the manufacturer gave up on
and understand why...) I'm working with the 1993 edition, and i'm not sure
the newer edition isn't better...

It's like Unix Man Pages. Every one of them assumes you've read every other
page! Talking to old RF guys is the same. At least the book doesn't get
bored when you access it over and over and over, trying to grasp an idea.
... [ibid.]

Yeah, but unlike the 'man' pages, i've been thru the relevant chapters of
the Handbook N times and still don't get it.

> To me, the ARRL Handbook always represented the ideal
> compromise between theory and practice. And it still does, to a great
> extent. But somebody had better put some effort into accessibility.
[John Miles]

I'm sorry, it's not there for me. As previously noted in a previous post,
it's a fine overview, but i feel there isn't much in there between the
theory and projects. What about the practice part of it?

The BIGGEST problem is there are no SIMPLE examples of circuits that the
no code tech can use!
...

I believe you have identified the primary reason no code techs don't stay with
the hobby actively. They don't _want_ to be component consumers (which folks
here accuse them of being). So when they start asking questions, they get
pointed to "The Handbook", and then get lost.
[geosynq@trader.com]

Maybe it's better in more recent editions(?), but it seems like the vast
majority of the projects that don't require substantial experience or
sophisticated equipment are HF-oriented. I guess in the old days, an elmer

would help folks get started. WA6GZU (i still remember the callsign after 33 years) was very helpful back then, but i've asked time and time again in the S.F. Bay Area for an elmer for VHF and above, and so far, no luck. Getting back to the projects in the Handbook, some folks might even wonder if it's not an attitude of "We'll force 'em to learn CW one way or another!"

No! Let's rant about this some more! I can even offer _specific_ topics! [ibid.]

Why aren't there QRP quality projects for 6 meters and above? The R2/T2 forms the heart of a state-of-the-art transceiver. It'll run just fine without a pre-amp and with a simple homebrew final for QRP use in the HF bands. And it's an excellent choice to connect to a transverter. But it's not standalone. You need a low-noise pre-amp, and with 3mW out, you need something to get up to at least 2W and then another module for serious SSB work. Not to mention a stable VFO. Not easy for 6 meter, a challenge for 2 m, and then what about 70 cm? By the time i'm all done, i figure, starting from kits wherever possible, i'm looking at over $500 just to get on the air. Do i have a better choice between that, lucking out at the flea market and converting a surplus mobile rig? No wonder ALOT of no-coders don't upgrade beyond FM! (And few even do much simplex.)

There are lots of neat IC's out there. Like the AD607, designed by Gilbert, which has a conventional mixer in its front end, but does alot of what R2 does (minus the audio processing) with its IF. Or one of several transmitter chips (Motorola has one for UHF and one for 6 meters), various synthesizers for 1.2 GHz and 2.4 GHz, or one of several transverters-on-a-chip for 2.4 GHz. And, of course, there are lots of conventional approaches utilizing simpler ICs or even the lowly transistor (such as a couple of ATV projects seen in that past five years). Or, utilizing the lowly MC3362 for 6 meters, instead of 2 meters given in its application notes, or for HF as in the 1993 ARRL Handbook ("A Portable QRP CW transciever for 20 and 30 meter", pp 30-26:30-32). (Of course, a pre-amp would be needed and perhaps a better VFO, but perhaps it could even be all-mode [minus opposite sideband rejection] without alot of extra effort.) No doubt, newer IDs might be better choices, and the MC3362's replacement is still available as a DIP.

Now, what about a reproducible project for 6 meters or above?

You are getting about as much out of those radios as they are capable of doing. There is nothing that will do better that does not require a license and better equipment. As to where to go next - get a couple of Codeless Technician study books and get yourselves ham licenses - then your communications will be anything that you want them to be. That is what ham radio is for. The questions are easy to memorize and code is no longer a requirement for the first license.

>had gone bad?

I have two guesses as to what might have happened (and they're just guessses!).

1) Even high quality milspec potted transformers and chokes go bad. All it takes is a single shorted turn on any winding and it's all over.

2) Lots of good looking military surplus transformers are meant for use on 400 Hz power and will burn up on 60 Hz unless run at a fraction of the rated voltage. This is because, for the same applied voltage and iron structure, you need far fewer turns for 400 Hz than 60 Hz.

Try applying 12 volts or so to the primary (adequately fused) and see what happens. If it gets hot and draws lots of power even with no secondary connection, it's probably bad anyway. If it stays cool, it may be a high frequency (400 Hz) unit.

Hope this helps.

Thanks, Bob.

I just wasted an hour downloading all their app notes. Total is about 11 megabytes.

I have never seen such incredible waste. Most of them are only one or two pages, yet they require 700k to a megabyte.

For example, 102.PDF, an app note on Transient Suppressors, takes 1,082,901 bytes. It contains 2 pages of text! No graphics, only text.

113.PDF takes 954,353 bytes. It is 1 page of text plus 2 small paragraphs on a second page. No graphics.

Some of the other app notes are completely garbled. I have the latest Adobe software, and have never seen PDF files this bad. My download software is reliable.

If they make semiconductors they way they publish app notes, I think I'll start making my own transistors.

Brian: Looked like a great project to me. I especially liked the
stage-by-stage construction process and the wooden baseboard approach.
I used the "build on wood" technique on my 20 meter superhet.
Crystals should not be a problem. You can have them custom made by
JAN crystals. For parts, use MOUSER or others. Order via
Internet or FAX to save time. Don't be afraid to modify the
circuits to your liking as you go through. Good luck.

Hi Tony,

Try putting 6.3 volts on the secondary and measure the primary voltages. If it still overheats it could have a shorted turn or be a 400 cycle xfmr. This might also indicate if the original labeling is wrong.------Joe---W1PNH

You're right, Tom. The relay contacts don't really face a
challenging amount of current, even at a currrent maximum,
but the spacing needs to be generous or arcing may occur
at a current minimum point.

Tony, if the windings are not shorted on either the primary or secondary coils the transformer should not overheat. Be sure that none of the coil wires are touching each other on the outside of the transformer and try it. If it overheats with no load at all it must be internally shorted - trash it. Good luck.

Dear All,
I am interested in building some switch mode supplies. My knowledge of transformer designs goes as far as turns ratios and stops about there. What would be a good source for designing such things. Basically I want to be able to select the appropriate number of turns for a given core, frequency, voltage change, power etc.

If this is covered by some simple ABACs or software could some one point me in the appropriate direction please. Answers both posted and Email would be appreciated.

Regards

Robin

# 4364. Re: 1759 meter band and "lowfers"

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-11 00:00:00 UTC
From: k5kne@aol.com
Message-ID: <19971111180500.NAA06168@ladder02.news.aol.com>
Source record: 89246

There was a club in California which offered a kit radio for this band. After considering the problems with antennas for this band, I decided not to pursue it.

It is my recommendation that you study and get your ham license before spending any money on that band. It is true that no license is required. But like everthing else free - it is seldom of any real value. Get a copy of the small Codeless Technician study guide from Radio Shack (about 10 or 12 dollars now). Don't get the big book (20 dollar range). You will be able to memorize the questions easily and a license will open a lot of doors for you.

Good luck. If you do decide to pursue the low frequency stuff - you should be able to find help on the internet.

# 4365. Does Solar Panel Need Regulator Before Battery?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-11 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bceed1$f00890c0$0b8a92d0@bitnet.bit-net.com>
Source record: 89247

I have acquired a gel-cell 12v battery (big one, similar in size to deep cycle marine battery).
I have also acquired a 12V 1A solar panel. If I want to trickle charge the gel-cell, do I need to protect the battery with a regulator of some sort?
I understand that gel-cells have a "attitude" about a too-high charging voltage. (Ooops, anthropomorphizing alert!)
Suggested circuit, please?

Member, Tsinghua University Amateur Radio Club, Beijing, China

Edited by Rick Niu, BD1QL
MBA '99, Columbia Business School, New York, NY
xn6@columbia.edu

BY1QH will be QRV on 144MHz EME at 1300-2300z, Saturday, November 15, 1997.

1400-1600z CQ
1600-1700z Listen around
1700-1900z CQ
1900-2000z Listen around
2000-2100z CQ
2100-2200z Listen around
2200-2300z CQ

BY1QH will always call CQ on 144.120MHz, using two-minute timing, with BY1QH transmitting in the first period. BY1QH plans to stay on 144.120MHz the full even hour, and stay there longer if someone is heard at the end of the hour.

During the contest, BY1QH will be QRV on a borrowed mobile phone: (86-10) 9085-4674.

So far BY1QH has worked SM5FRH, SM5BSZ, SM2CEW, KB8RQ, and W5UN.
If you want to see some pictures taken at BY1QH just before the first leg of the ARRL EME contest, take a look at the homepage of PA3DSS:
http://www.horizon.nl/~tdekkers/by1qh/index.html.

CHINA HAM NEWS is available for unlimited, appropriate distribution.

## 4368. tube screen bias help

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-11 00:00:00 UTC
From: "Jeff W. Hockert" <hockerj@ece.orst.edu>
Message-ID: <Pine.HPP.3.96.971111115450.7712B-100000@holmes.ece.orst.edu>
Source record: 89250

I am working on a xtal controlled, CW tube transmitter using a 12BY7A as the oscillator, coupled to the grid of a 5933 as the PA. The existing circuit on both tubes uses the same supply voltage for both the plate and the screen (isolating the plate with a RF choke). Typical circuit examples usually show a biasing resistor dropping the screen supply below the plate. I am only using 175v supply (that was the regulator tube I had available), which puts me well below rated supply voltage (plate or screen on either tube).

My question is, do I need to drop the screen voltage below the plate for proper operation? Or can I get away with using the same voltage for both because of my low supply voltage?

TIA

Why not use the TenTec 1208 Transverter? This will allow a multimode HF rig (via 20 meters) to receive and transmit 6. (It is a kit, $95.)

Power is limited, I understand the TenTec has a max. capacity of 10w in and out, but I suppose a linear on 6 is possible with the proper relay setup.

Source record: 89254

Howdy,

I am working on a 20 meter superhet receiver and am using the AD607 as the mixer, IF, and demodulator stages. It is designed to demodulate QAM, it has "In-Phase" and "Quadrature" modulation outputs. The data sheets say that the chip will demodulates ssb and cw as well. I assume that by applying a BFO signal to the demodulator that is tuned to the IF will yield the SSB signal at the In Phase output, where I can go straight to the audio chain. Has any body used this chip in a CW or SSB application? Any info at all will be reatly appreciated, thanks.

No prob, hope the feedback is helpful!

> I will note, however, that I don't think the points you raised
> necessarily apply to all of the chapters.

I agree... I was only ragging on the layout of the "receivers" chapter
because it happened to cover the topics that were brought up by the
fellow who wrote me. That's a pretty important chapter, IMHO, because
it's responsible for introducing so many basic electronic concepts.

All in all, I actually think the newer Handbooks look great. The
language is clear and informal without being gratuitous, which is always
a fine line to walk. And the content is dead-on target for the most
part.

For example, I think the RFI
> chapter (okay, it was mine!) and the DSP chapter were organized "from the
> beginner to the intermediate," leaving the finer points to be picked up
> by our other publications -- what I perceive as the appropriate "Handbook
> goal."
>

Agreed on all counts.

Switch-mode supplies are rather tricky to design. Horowitz and Hill have
a good explanation in the A of E.

# 4377. Need to build 929MHz Receiver. . .

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-11 00:00:00 UTC
From: George Viaud <geo69@concentric.net>
Message-ID: <3468F025.4EFA8AD3@concentric.net>
Source record: 89259

I am presently looking into building a 929MHz receiver
to be used in conjunction with my PC to decode POCSAG . .

If anyone knows how to design receivers at this frequency,
or better yet has a schematic or knows of a place where I
can obtain a schematic, an email telling me so would be
greatly appreciated. Any help would really be great.
My ARRL Handbook (1988) doesn't have any receivers near
my desired Frq. range. . .

Thanks!

George

## 4378. 2m or 70cm AMPs?

Newsgroup: rec.radio.amateur.homebrew

There seems to be lots of homebrew Liniears out there for HF ... where the amplifiers for VHF and the low end of UHF???

Please respond to tljess@itexas.net!

Thanks, 73 KD5BWD

# 4379. Looking for a 2m or 70cm Pager SIzed XMTR

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-11 00:00:00 UTC
From: tljess@itexas.net
Message-ID: <648g0u$g5r@news1.iamerica.net>
Source record: 89261

ORIGINAL Question to Fox-List:
I am looking for a pager sized fox to use sort of like an EPIRB. not a lot of output power. Small enought for a hike to be comportable wearing. Any ideas ... circuit deisgns etc. The important part is to be much less expensive than the standard 400 MHz or 900MHZ EPIRB.

---

Below are your several ideas and comments ... hopefully the first few of several. I like Kevins idea of fiiting it in a "Sharpie Pen". The low power of 10-50mw should be sufficient ... I would like this to be a "learn more about Amateur Radio and do something useful projects". The "Stubby Duck" antenna is workable ... if it is on 440 it would make things more reasonable in the antenna area. Looks like the FET oscillator works for that plan.

A schematic and a parts list seems in order. I don't have the where-with-all in that area, lets see what we can come up with.

I got the little idea that this could be made real small by looking at the 140mw XMTR used on OSCAR I ... a few resistors, caps, inductors and only 2 transistors. Also some of the commercial Foxes seemed real small.

Look over each others ideas and lets see what esle we can stir up. The least of my hopes it to by it ready to go ... I like "home brew" and networking with you all is half of the fun.

Some Background:
-- EPIRB - "Emergency Position Inicating Radio Beacon"
They operate on 406MHz and or 121.5MHz and several satalites report them to authorities - ID and posit. These operate as from 50mw to 5W. The prices I have seen are from $200 to over $2000. The EPIRB ID is registered and then when yoy file your travel plan you list youi EPIRB and the authorities know your genarl plans.

My plan is to know that several of my own group are hiking and then use the "psuedo EPIRB" to track them if needed.
73's looking forward to our next CyberQSO

TomE - Arlington, TX KD5BWD
---
Much smaller than a pager, you can go with a single FET oscillator. Fits well into a "magic marker." If you can get AAAA batteries (they're a little hard to find) you can get it into a "sharpie" pen.

The simplest FET oscillators in the Sams FET book are fine. Cost is, indeed, less than an epirb (approx 1% of an epirb. 0.3% if you have a good junk box).

The little 1.5 inch stub-duck antennas for 2m that most people laugh at, you see 'em at flea markets - don't laugh. Put one on an analyzer and you find they really do work. The good ones have a tiny 28 ga or so gold plated helix inside which really does resonate at 2m. No reason you can't wind a good resonant antenna like that.

You'll definitely be QRP with a watch battery, or AAAA cell for power, and a pip squeek of a little coil for an antenna, but it works.

For a couple of bux extra, pick up an electeret mic element at Radio Shack. Smaller than a watch battery. If you bias the FET with the thing, you'll actually end up AMing and FMing the output
at the same time - but it will work.

XTAL control is much better than just a free running LC circuit for the thing, but you'll probably never find a suitable crystal that will fit into a "sharpie" marker. (I never could) And an XTAL FET osc
only takes an FET, the XTAL, one resistor, cap, and coil, and the coil itself can be the antenna if you like.

Kevin WB9MUP ( wb9mup@amsat.org )

---
I think I can put something like that together. Depends on what exactly you what it to do and how small a tx board I can come up with. May depend on supply pwr too.

Leon ( microchip@centuryinter.net )

---
I'm "working on" one... As the winter months come on, I may actually get a round tuit. It will be based on a Motorola chip for the transmitter, and a Microchip PIC processor to control it. It will have MCW ID, and crystal controlled timing for the processor, which could be programmed to turn it on and off as desired ("Wait till 9PM on Saturday next, then start transmitting one minute on/ four minutes off..."). The transmitter chip is cute: it's a phase locked loop, which multiplies the crystal by 8 or
32, depending on whether you choose an MC13175 or MC13176 chip. You can modulate either FM or AM. The PLL avoids the several stages of multiplier. The output power is about 10 milliwatts. My plan is that I'll take apart a NiCd "9V" battery, which is 6 cells, and remove 3 cells. The transmitter
will fit in where the 3 cells were, and the remaining cells will provide power. I plan to do it for 2 meters, but the chips officially are designed for 350-950MHz, so you could put the transmitter anywhere in that range.

I _believe_ they will work fine on 2 meters, too, but I'm not positive about that yet.

Interested?

Cheers,
Tom

Source record: 89266

Ken, let me encourage you to not pursue a kw amplifier for 6 meters. As you get more experienced in ham radio you will find that "doing it with antennas" is a lot more productive than running high power. One big negative about high power is TVI. Six meters is very bad about causing interference to neighbor's tvs and fm receivers. Another negative is the expense of building or buying such an amplifier. Another problem you will encounter is feedline and antenna perfection - you will burn up your amplifier, and coax if everything is not perfect with that much power.

One of the main things is "You can't work them if you can't hear them". Unless you have a fantastic antenna system - a kw will not do you any good unless you have the receiving cabability. Receiving is mostly antenna. Your receiver is important, but a good antenna is more important. You are better off with a good antenna and a fair radio than with a poor antenna and the most expensive radio money can buy.

Put you money on the antenna and forget about high power is my recommendation after 36 years of hamming. Good luck.

## 4385. Re: Regen Receivers

>I am working on re-building an old crystal controlled, CW tube transmitter

>How do you mount the tube sockets?

I like to make the front panel from masonite: when painted it gives a very hansome gloss look. You can contact cement aluminum foil to the back side. There used to be tube sockets made for the breadboard. They mounted flat with the connect-lugs comming out at a right angle. I'll bet you could still find them at a good size hamfest, but in the meantime, I have used chassis-type sockets mounted to the breadboard using standoffs and wood screws. Again, if you begin by gluing aluminum foil to your board you will have a decent planar ground. In the "old days" the grounding was handled by heavy bare wire...called the "ground buss."
Hope this helps some,

K0MB

This would be a strange choice for cw service.This tube was designed for class A amplification. I don't have access to the output impediance of this tube. Most rigs of early vintage used link-coupling, and the links and couples were made specifically for the band in use. Maybe another will step up to help on this.

DavidC (davidc@bit-net.com) wrote:
: I recently acquired a used gel-cell battery. It is a large (car battery
: size).
: It measured just under 9v when I got it. I connected a 2.5A 13.8v Micronta
: PS I had laying around and started the charging process. After several
: hours the battery was up to 11v.
: My concern is that the PS is getting very hot, should I have diodes in the
: charging line or something to protect the PS, or is the process of bring
: the voltage back up in the battery just unusually taxing on the PS?

A gel-cell battery of that size can draw a fair amount of current-the
current will go down when the battery is near full charge.

: Oh, and my meter is unable to measure the amperage over 600MA, what
: inexpensive metering setup would be good to monitor this battery - the goal
: is to keep a trickle charger (the Micronta?) on it.

One way to measure high current is to find a high power low ohmage
resistor(under 1 ohm is best, to reduce voltage drop).
Put the resistor in series with the battery, and put the meter across
it:simple ohms law will allow you to determine the current.
If you can't find a suitable resistor, then use a length of wire...if a
digital meter is used, copper wire may do, but if a analog meter used,
then resistance wire may be needed.

: Thanks in advance for your help!

This chip is usually used to feed the I and Q outputs into a DSP, where
any type of demodulation can be done in software.

The External mike jack only has TWO connections, it's not a stereo
jack. The CAT connection, which is the third connection on the
top of th HT does use a stereo plug and has a stereo jack.

For a TNC to key properly, I usually used somewhere between 3000
and 5000 ohms to key reliably, although as I recall, it would work
without too much loading down to 2000 ohms. I also note before
you spend too much time playing with this, that Radio Shack and
MFJ both provide external HT microphones which will work with
the 727.

>
>

As a closed loop servo system, a switch mode power supply has lots more complexity than the transformer! Particularly if you want to live with the noise they generate. Most people that design them still are considered black arts magicians. Get the books from the manufacturers. Unitrode for the chipsets. Ferroxcube for the core material and the design equations. These are just the first two that come to mind, there are a dozen others. Then study them.

>"Now may the God of hope fill you with all joy and peace in believing, that
>you may abound in hope by the power of the Holy Spirit." Romans 15:13

David,

I run solar panels to power my repeater and the only thing that I have
put between my panels (4-amps per panel) and battery bank is a solar
panel controller. This controler cost about $40 and what it does is
shut off the current from the panel(s) to the batteries when the
batteries reach a voltage of 13.6 volts. When voltage drops below
13.4V, then the controller opens up and current starts flowing again.
Your 12V-1Amp panel is small and I would guess it will have a hard
time keeping your battery fully charged if there is any kind of load ,
on the batteries, so I do not think you have to worry about damaging
your gel-battery.

I have the Astatic D-104 microphone mounted on the T-UG8 stand (with built-in amplifier).

1. What is the impedance of the D-104 element?
2. What is the small slide switch mounted inside the base with positions marked "E" and "R"? How do I set it? I intend to connect this microphone to my Yaesu FT-840 HF Transceiver (requires 500-600Z impedance input).

Thanks for your assistance.

There's also the TenTec 2m-6m kit (1206?), it uses whatever you've got
on 2M.

Only problem with this solution is that it's designed for HTs and it only
take 5W in, has anyone tried modifying it for use with a 10W rig?

# 4409. 3-500Z AMP on 160M

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-12 00:00:00 UTC
From: Wes Atchison <wes@iphase.com>
Message-ID: <346A8421.19BB508F@iphase.com>
Source record: 89193

I am rebuilding a HF amp that uses a 350-Z. The amp was designed to operate 160 m thru 10m. I can not get the amplifier to resonate on 160m. On 80, 20 and 15 meters the amp works fine. On 40m the protection circuit trips before I can get the amp to take any drive. The meters do not indicate an over current state when it trips. I think this is a resonance in the protection circuit. On 10 m the plate RF choke fried.

I rewound the choke and have the amp work like before on 80, 20 and 15. 40m works the same. Have not tried 10m. I wound the choke with the same number of turns as a 2 tube amp. This choke had more turns than the original in the amp. I checked the tank circuit that with my grid dipmeter to see if it resonates. It does. I think the RF choke is not of a high enough impedance at 160m.

What I am looking for is help in determing what the RFC should be for a 3-500Z operating on 160 thru 10 meters. Also, any experience with the bypassing of the RFC.

>I wish more folks would offer us constructive feedback.

I also think that the "dumbing down" charge is absurd. The Handbook offers more information on modern radio practice than did the older Handbooks (one would hope that would be the case, and it is). It isn't a cutting edge volume by any stretch, but it isn't dumbed down compared to earlier editions either. Much that was archaic has been cut, but it isn't really missed. I like several of the new additions such as the electronic math tutorial and the chapter on DSP (though that's a bit light, some algorithm examples would be welcome to point the budding coder in the right direction).

Where it suffers is in comparison to some other reference works, such as some RSGB publications, which go into more detail about various things than the Handbook offers (though much of the RSGB information is dated).

But I must say that the organization really is the pits. I use the Handbook as a quick reference, and the indexing, table of contents organization, and internal chapter organization for rapidly finding specific information is just simply awful compared to the older Handbooks.

A handbook is supposed to be a quick desk reference, but because of the poor layout and organization, the ARRL Handbook isn't a quick desk reference anymore. The CD remedies that to an extent because one can employ search techniques to find needed information, but the paper volume could stand a serious attempt to get it back into a shape that allows quick access to specific information.

Specifically, I would like to see a return to a comprehensive table of contents in the front of the book, including intra-chapter headings and a list of figures. Most important, there should be *page numbers* in the TOC. I'd like to see the Handbook pages numbered sequentially from start to finish as it used to be rather than renumbered at each

chapter boundary. That would at least give a clue as to how deep in the volume to start a search.

And the index needs to be more comprehensive as well. Ideally, a permuted index would be preferred, or at least a lot more "see also" cross references. Most things are pointed to by the index, but not always under the headings most likely to be searched first.

Chapter organization should follow a logical flow, with the more basic information leading into more comprehensive details. I agree with those who think that the receiver chapter needs a total rewrite. Most of the information one would want is there, but it is so scattershot that it is difficult to access quickly or absorb coherently.

Both the receiving and transmitting chapters need to be tied to the modulation chapter, and that needs to be expanded to cover demodulation more throughly. There is an unfortunate tendency in both the receiving and transmitting chapters to make assumptions about the sort of modulation which will be employed which aren't always justified today.

Sorry, I should have checked the AD607 data sheet before sending the
above. It is obviously intended for use with special baseband
converters.

As I read the data, for SSB you need to phase-lock your BFO to the
internal VCO, by feeding it to the FDIN pin, instead of the IF, which
would be used for AM demodulation. I don't think that you be able to get
away without the phase-locking, because the internal VCO will then be
free-running.

A DSP could be used, of course, as I suggested, to do the SSB
demodulation on the I and Q baseband outputs; you wouldn't need the
phase-locked BFO in that case.

>Suggested circuit, please?

If the panel has a reverse polarity diode in it (and most intended for
battery charging do), then just hook it to the battery and walk away.
If it doesn't have the reverse diode, install one. This prevents the
battery from discharging through the solar panel when there is a
LOLI (Loss of Light Incident).

The reason you can do this is that the 1 amp rating is the *short
circuit* current rating of the cells. It won't be able to deliver that
much current at 12 volts. In bright sunshine, a 12 volt panel will
produce about 18 volts *no load*, but even a light load will drop
the voltage down near 12 volts. So it is inherently self-limiting when
connected to a large gell cell.

Note that a 12 volt 1 amp panel is *not* a 12 watt panel. The ratings
on these things don't work that way. You don't get *both* 12 volts
and 1 amp at the same time. A 12 watt panel would have a much
larger short circuit current than 1 amp. But even a 12 watt panel
won't harm a large automotive size gell cell. If you had a 50 watt
panel, you'd need a charge controller.

Noting the smiley, if you must send CW, you can do it with the DC receivers too since their LOs are on frequency, but only when you want to, and not all the time. That's the problem with the regen, unless it is fronted with a good unilateral front end, it radiates madly all the time. (DC receivers can radiate too, if they aren't designed properly, but a good DBM does offer some isolation not present in the simple regens.)

> I wish more folks would offer us constructive feedback.

I'd suggest the Hanbook not try to compete with Horowitz and Hill's Art of Electronics, but rather referencing that book and an equivalent book for RF (is Hayward's ARRL press RF Design book _the_ book? I'd hoped Carr's RF book was, but it's just a colleciton of magazine articles. If Hayward's isn't the A of E of RF, we need one!).

> I will note, however, that I don't think the points you raised
> necessarily apply to all of the chapters.

Agreed, I've found some of the chapters useful, without significant prior background. Whether the Handbook should be a tutorial or a reference or a dual purpose book is the key question. Even though I'm a beginner on the hardware side, I'd recommend the handbook being a reference volume with other books supplying the tutorial.

In the old days, the Handbook (perhaps together with the license study book that taught you about Pierce oscillators etc) were all one really needed to learn what you needed _and_ to keep working on it; it can't be so today.

The handbook should NOT look like a shovel-ware collection of QST articles loosely sorted by topic (which I think is the criticism levelled at the Receiver section, if I'm not mangling it); this is appropriate for the Antenna Compendia books, but as you, Ed, correctly note, the editors of Some sections take care to truely edit the section into a coherent whole, and we would like to see the rest of the Handbook so well organized, with a sensible progression of the material in each chapter/section. But it is fair to assume basic electronics in the projects sections.

I just renewed my ARRL membership yesterday, and added QEX subscription, so I'll (hopefully) get some decent projects to read in addition to the magazine that every month tells me how great CW is. Now I gotta go through all the ARRL pubs I've got and clip the litte coupons so I can get my member discount on the rest of the books I need (starting with Hayward, I think, but also the rest of the Compendia volumes).

> Please don't assume everyone has HF gear.

It's perfectly legal for a Tech-minus (like me) to OWN an HF
transciever (as I do) and operate it into a dummy load (will need to
when it gets its turn on the bench) or a transverter (I don't,
probably won't). And HF multimodes usable as IF's are a lot cheaper
used than the VHF/UHF multimodes one sees used!

> The point of the question was
> to look for ways for a Technician to get beyond FM-only operation. If you
> *have* to suggest HF, at least choose a band with Tech Plus privileges.

As previously noted in another thread, the 1208 was put on 20m
because 10m has a harmonic that's hard to filter on 6m.
You can go from 10 to 2 or 440 but not to 6 easily.

> With a six meter transciever, the transverters to other UHF

I thought most WS transverters used a 144-148 IF. This is why
I bought an ancient 2m multimode when I saw one cheap, because
it had NFM, WFM, USB, LSB, and CW. (Probably a collector's
item, who's ever heard of a Fukuyama/ITC Multi-2000 ? :-) I
gotta retrobrew a PL and selectable filter sizes into it (I
think it's got the same RX filter for NFM and WFM, and rumor
is we're going to shift from mixed 15/20kc spacing to 12.5kc
on the repeaters. I'm already getting too much co-channel
from repeaters up 20kc as it is!)

> sense. Hence the request for kit/homebrew suggestions for 6 meters (besides
> the excellent state-of-the-art R2/T2 pair).

Sounds like you've given your own answer? (Or are they FM only?)

The assumption does seems to be that Homebrew/kitbrew is either (a) CW
or (b) based on a commercial SSB/FM IF radio. Homebrew/kit for SSB are
few and far between, and little enough for VHF+ too. (After all,
it's well known that Tech-Minuses grabe the wrong end of the
soldering iro ?-( )
Far Circuits has an index of magazine projects for which they have
circuit boards and reprints; it's a pretty good list of what
projects have appeared lately.
There's some activity -- in Cuba and elsewhere -- in homebrewing HF

DSB-SC , which should be applicable to VHF too. I think the NE-612
would work in that applicatoin.

: unilateral front end, it radiates madly all the time.

Gee, regens have kind of passed out of my vocabulary, but my recollection is that a regen doesn't radiate...a superregen does. Have I just forgotten?? I'm thinking of a regen as an RF amplifier with positive feedback below the point of oscillation, with something to detect the RF amplitude in its tank, and a superregen as a gated oscillator, where the amplitude of the osillation at the end of the gate time is proportional to the RF (signal level) in the tank at the start of the gate.

hi all,
I try to make 2m receiver with motorola MC3362 but I didn't prepare
LO OSC L(0.41uH) C(33p) connected PIN 21 and 22.

Does anybody know which component (L and C) i can use for the
144-148 MHZ or how do i calculate value of L and C.

# 4418. Essay Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-12 00:00:00 UTC
From: "Edward, III Dickinson" <eddick@worldnet.att.net>
Message-ID: <64cgoq$od4@bgtnsc03.worldnet.att.net>
Source record: 89202

The following table is contained in an article in October 1997 QST, 'Official Journal of The American Radio Relay League'. The article, "What's New About the FCC's New RF-Exposure Regulations?", by Ed Hare, W1RFI, is on pages 51 and 52.

Table 1
Power Thresholds for Routine Evaluation of Amateur Radio Stations

| Band (Wavelength) | Transmitter Power (W) |
|---|---|
| 160m | 500 |
| 75m | 500 |
| 80m | 500 |
| 40m | 500 |
| 30m | 425 |
| 20m | 225 |
| 17m | 125 |
| 15m | 100 |
| 12m | 75 |
| 10m | 50 |
| 6 - 1.23m | 50 |
| 70cm | 70 |
| 33cm | 150 |
| 23cm | 200 |
| 13cm and up | 250 |

ESSAY QUESTION

Compare the frequencies aligned with lower power thresholds with those which may be useful to Low Earth Orbit satellites. Include in your discussion the implications of non-structured communications verses a potential preponderance 'organizationally prepared' information. Discuss the ramifications of this with the potential dampening of freedom of communication throughout the world. Additionally, discuss the idea of vertically integrated information processing entities dominating the RF Spectrum. References to other recent restrictions on the airways, may be included.

As you see fit, please post this 'essay question' where it may be viewed by Radio Amateurs and interested others.

You need to limit the current to 10%-20% of the batteries ammp/hour
rating (for nicad and probably most others). Heat damages batteries.

You can limit the current with a LM317 voltage regulator, as long
as you run less than 1 amp. Radio Shack has them. You can wire them
up with one additional resitor to make them a current regulator.

>Oh, and my meter is unable to measure the amperage over 600MA, what
>inexpensive metering setup would be good to monitor this battery - the goal
>is to keep a trickle charger (the Micronta?) on it.

Jerry rig a 1/10 ohm resistor (you could use coil of wire).
Put it in series with battery and charger. Measuring voltage
across it will tell you the current.

# 4420. FS: Triad TY-84 power supply transformer & pulled tubes

Newsgroup: rec.radio.amateur.homebrew

For sale: Triad TY-84 power supply transformer for 12.6 volt DC mobile power supply, DC input 12.6 volts, DC output 600 volts 200 ma, *Average Switching Frequency* 2500 cps. Commonly used in 1960s power supplies. Nice to have if you want to use an old mobile tube tx in your car/rv. $20. Also: 7 tubes pulled from junker tx, 0A2, 6DE7, 12AX7 (Mullard!), 6AU6, 6CL6, 5763, 6146. All test good except 0A2 and 5763 which couldn't be tested. $40. All obo. Remove spamblock xs to reply.

No, but I did do an analysis on the first amp's network values
published and found them not to be correct. In a much older post
somewhere I did publish the correct values for the 300W amplifier if
it is to be actually in Class E.

: >How do you mount the tube sockets?

: I like to make the front panel from masonite: when painted it gives a very
: hansome gloss look. You can contact cement aluminum foil to the back side.
: There used to be tube sockets made for the breadboard. They mounted flat with
: the connect-lugs comming out at a right angle. I'll bet you could still find
: them at a good size hamfest, but in the meantime, I have used chassis-type
: sockets mounted to the breadboard using standoffs and wood screws. Again, if
: you begin by gluing aluminum foil to your board you will have a decent planar
: ground. In the "old days" the grounding was handled by heavy bare
: wire...called the "ground buss."
: Hope this helps some,

: K0MB

I put together a TRF broadcast radio together on a piece of pine.

I used 8-pin wafer sockets for the tubes and simply bent the pins
outward so they sit pretty. Wood screws through the mounting holes
kept them in place. If your are worried about looks, try using
the wafter sockets (cheaper) or the phenolic sockets with standoffs
(avail from radio shaft) and wood screws. The circuit grounds are
all common and you can just pick a point to which you attach a
fahnstock (sp? sheesh sorry) clip and go the the ground rod or
cold water pipe (with on pvc in line with it anywhere of course).

To mount the tuning capacitor and vol controls, just used small
pieces of aluminum angles. Of course, you could also just come
up from the bottom of the pine to secure the tuning capacitor if
it is constructed that way. For a dial, I just used a piece of
thin acrylic and used dry transfer for the markings then krylon
sprayed it clear.

I used the old shouldered 6K7G type pentodes for rf amps etc...
so my sockets were the old 8-pin type, but you can do the same
thing for 7 and 9 pin projects too!

I wound the interstage coils using enameled #24 wire on
toilet paper tubes.

I also later built a superhet using 7-pin AA5 lineup, wound my
own IF coils using #30 wire on acrylic rods (no shield) and
also the oscillator coil was done this way, bank-wound.

They both work great. The superhet was built on an aluminum
chassis with an acrylic front panel and I included an S-meter.

I hope you have as much fun as I did building your rig on pine!!!
They look cool too.

And if you live in the greater S.F. Bay area and are interested in what
you read there, please write via at my callsign at 'qsl.net' (or remove
"nospam" from the "From:" Address).

Gary, thanks for pointing out the 1.2Mg work to me. I don't think
i've looked at this site after the 1.2Mb material was added. Their
new network map is certainly impressive!

http://lois.kud-fp.si/hamradio/prmap.html

I'm interested in whether the AD607 might be used to make a simplified
version of this, not necessarily at 1.2Mb (such as at LocalTalk speeds
(~250 Kb??), which would plug directly into a Macintosh or a PC LocalTalk
card). I'm also interested as to whether the Manchester card might be
suitable for medium-speed packet at 70cm. Or whether some of the 2.4Gb
chips might be applicable, especially the ones for the European cellular
standards (e.g. non-spread digital).

-- KD6PAG (Networking Old-Timer, RF newbie)

P.S. Gary, thank you for explaining what is my major motivation for
learning about RF design/construction.

Sorry I didn't respond to the original posting -- it hasn't arrived here
yet.

Solar panels typically do deliver a sizeable fraction of their
short-circuit current into a battery. They're essentially constant-current
sources, although a bit sloppy.

One small panel I have, apparently intended for charging "12 volt"
batteries, is probably typical:

Open-circuit voltage 20.7 V.
Short-circuit current 0.3 A.
Current into 14.2 V. = 0.24 A.

# 4441. Re: help re: typ 5633 output impedance

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-13 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <19971113020100.VAA15093@ladder02.news.aol.com>
Source record: 89209

Are you sure the tube is a 5633? I can't find the 5633 in any of my ARRL handbooks or RCA tube manuals (rx and tx). The 5933, however, is quite common - it's just an improved 807. The 5933 (also called 807W) has a 5 pin base and a plate cap.

To answer the output question, the equation I've always used for Class C operation is:

Zout = Vplate/(2 * Iplate)

that is, the plate voltage divided by twice the plate current. For Class B or AB, the multiplier of 2 is reduced to 1.75 or so. This gives a working Q of 12 or so.

Good luck! Rig here uses a pair of 807s at full ICAS ratings (150 watts input) and I get at least 100+ watts out.

## 4442. MC1542 pinout & specs

Newsgroup: rec.radio.amateur.homebrew

Am repairing a Sylvania HF receiver that uses MC1542
for audio amps. Any pointers to a pin out/specs on the
net? It's not listed on several IC web search sites or
in the latest Tech America/Radio Shack catalogs.

Thanks in advance,

P.J. "Josh" Rovero email: provero@connix.com

Thanks for the info Leon, I think I will be okay by just building a simple
Crystal oscillaor BFO operating at the IF minus 1.5 kHz for USB. The output
of this oscillator will be applied to FDIN . Does this seem reasonable to you?

If AM is your game, you're right Tom, the regen is kept at the point
just before oscillation sets in, which can be darn hard to do, and the
howling when it falls into oscillation can blow the cans right off your
ears. But if you're receiving SSB/CW, then you have to deliberately
put it into oscillation to demodulate the signal. Since you won't find a
lot of AM on the ham bands today, your regen will be operated as
an oscillating detector.

Because the regen was hard to maintain right at the edge of oscillation
(because a signal can pull it over the threshold), the superregen was
developed. It has a quench circuit which forces the oscillating stage
to quench back out of oscillation at an ultrasonic rate. That avoids
some of the pulling problems and makes adjustments less critical.
Of course it radiates like mad too.

The output impedance of the element is well over 100KOhms. But the
amplifier has an output impedance of only a few hundred ohms, suitable
to drive the lower impedance inputs common on some rigs.

There's also the TenTec 2m-6m kit (1206?), it uses whatever you've got
on 2M.
Only problem with this solution is that it's designed for HTs and it only
take 5W in, has anyone tried modifying it for use with a 10W rig?

Subject: Designing Transformers
Dear All,
I am interested in building some switch mode supplies. My knowledge of
transformer designs goes as far as turns ratios and stops about there.
What would be a good source for designing such things. Basically I want
to be able to select the appropriate number of turns for a given core,
frequency, voltage change, power etc.

If this is covered by some simple ABACs or software could some one point me in the appropriate direction please. Answers both posted and Email would be appreciated.

(about a remote antenna-switching relay:)
: At the 1.5 kW level, you need a sustain current capability of about
: 3.33 amps for a 450 ohm system, or about 5.48 amps in a 50 ohm
: system. So the relay doesn't have to be that big at all.
(Oops, Gary, I think you forgot the sqrt on that 3.33 ... I get sqrt(1500/450) = 1.82 amps RMS.)
But...beware of voltage! 1.5kW at 450 ohms is about 1200 volts peak (821 volts RMS). And...if the antenna impedance really is higher than that, like a full-wave center fed dipole at maybe 2000 ohms, the voltage would be twice that for that power level. If an arc gets started it only needs a small voltage to keep going. Antenna switches and relays that work in systems where there may be high impedances usually have pretty wide contact spacing, from what I've seen...or operate in vacuum. If in air, they also usually have nicely rounded corners. A point of comparison is air-variable capacitors, which at the few-kilovolt level have fairly wide spacing and rounded edges on the plates.

From: Michael Black <blackm00@CAM.ORG>
Subject: Regen Receivers
Your recollection is correct, but...
If you add positive feedback to an amplifier, to get gain and improve

selectity (such as in a q-multiplier), it's not oscillating so it doesn't
radiate.
But for demodulating something without a carrier, cw or ssb you have to
get the carrier (ie bfo) from somewhere. Regen receivers (and
q-multipliers in some designs where they acted as BFO's) get the carrier
by actually going into oscillation. Thus they can radiate.
Since regenerative receivers tended to be built without a preceding RF
stage, in effect the oscillating stage is directly connected to the
antenna. The oscillator in a superhet might not necessarily have a lower
input power than the oscillating detector, but there is a mixer between it
and the antenna, which may or may not isolate the oscillator. And the
higher the IF in a superhet, the further away from the signal frequency
the oscillator is. Thus the bandpass filtering in the front end acts
as a filter between the signal from the oscillator that makes it through
the mixer to the antenna. Of course, there probably have been many a
simple superhet in years gone by that did radiate quite a bit, considering
the simple mixers used and the 455KHz IF.
The superregenerative receiver does radiate all the time since it is
an amplifier on the verge of oscillation, and the quench oscillator (be it
built into the detector or a separate oscillator) kicks it into
oscillation.

In the very early days of radio, all radios where board mounted. Perhaps the
most famous maker of such radios (AM Receivers) was Atwater Kent.

For a site that is loaded with pictures of the breadboard AK's take a look at:
http://ourworld.compuserve.com/homepages/johnj_Radios/Breadbd.htm

To see how these evolved into beautiful pieces of furniture that a look at:
http://web2.airmail.net/vanew/

Some radio buffs would buy radios with chrome chasis's and have wooden cases
custom built for them. As companies realized there was a broader market for the
radio, they began to bring out radio's at affordable prices for family use.

For a starting point to find these sort of parts:
http://www.antiqueradios.com/resources.shtml#parts

However, I must say, I have not seen these type of tube mounts for sale.
Your best bet is to email the owner of the first site I mention above. He might
be able to direct you to a source for such sockets.

You are only limited by your imagination with this type of project. If you really wanted, you could "manufacture" the tube mounts yourself.

Hope this helps,

Peter Mikalajunas

That isn't an index - it's a list prepared by a brainless computer.
Professional indexers do use computers, of course, but they use
specialist software. The so-called "indexing" features of word-
processors don't give them what they need.

A good index needs a lot of creative human input to identify which key-
words readers will want to look for. The key-words often don't exist in
the main text at all (eg condensers - see capacitors) so only the
indexer can think to include them. Only a real, human indexer can find
the optimum balance between length and detail.

>If you want a good example, see
>the Radiotron Handbook, fourth edition. Back then they did it manually.
>
Exactly my point!

>I can seldom find what I am looking for by looking in the ARRL Handbook
>index.

That can happen, when the reader and the indexer have totally different
ways of your way of thinking about the subject. It usually indicates
that the reader has an individualistic, original and quirky turn of mind
:-)

> Plus index listings for the References section frequently list the
>wrong page.

At last we agree - there's no excuse for that.

From: aswNS@hamp.hampshire.edu
Message-ID: <346c75be.0@192.33.12.30>
Source record: 89140

On 11 Nov 1997 18:43:17 GMT DavidC (davidc@bit-net.com) wrote in rec.radio.amateur.homebrew:

: I have acquired a gel-cell 12v battery (big one, similar in size to deep
: cycle marine battery).
: I have also acquired a 12V 1A solar panel. If I want to trickle charge the
: gel-cell, do I need to protect the battery with a regulator of some sort?

Solar arrays have a voltage-current characteristic which allows them to be short-circited at one extreme. At the other extreme of no load the voltage soars. Typically a panel designed to charge a 12 volt battery will have an open circuit voltage of 18 to 20 volts. But a relatively small current drain will drag this down a lot.

To decide if a regulator is necessary you need to measure the current the cell delivers into your battery at its fully charged voltage (from 13.6 to 14 volts). If this is greater than the permissible trickle charge you should arrange a high voltage cutoff circuit, as mentioned in other replies. Alternatively, see if the voltage soars unacceptably when the array in full sun is connected to a fully charged battery. At the other end, excessive battery discharge is bad for lead-acid cells, although the type of battery you are using is not as vulnerable as an automotive starting battery. If there is danger of your equipment discharging the battery below an acceptable level you should also have a low-voltage cutoff.

The exact details of acceptable discharge level and maximum voltage under trickle charge conditions vary a lot between different types of batteries, you would do well to try to get technical specs for your particular battery.

All solar cells put out between 0.45 to 0.5 volts per cell under no load in full sun, but how they are connected in arrays varies. I am using an array with 33 cells, and feel a controller is needed because the voltage will soar to well over 15 volts when my battery is fully charged without a controller. Other arrays are made with fewer cells, and are sometimes designated as self-regulated, meaning they are designed to be unable to overcharge the particular type of battery they are intended to be used with. Some arrays have a diode built in. This is intended to prevent arrays in parallel wasting energy if one panel is partially shading, but a diode will also prevent a battery from back-discharging through a panel in the dark. (Solar cells are diodes themselves, but not very good ones). A built-in diode or an external diode will also result in about 0.5 volts less than the full output being applied to the load. You might be able to make an array with somewhat high output effectively self-regulating just by

putting several diodes in series with it and your battery.

Hello,

The Fall 1995 issue of Communications Quarterly has an in depth and
most excellent article on the design of regenerative receivers.

BTW, the Fall 1994 issue of the same magazine had an equally good
article concerning super regenerative receiver design.

Thanks to Al (and others) for the good practical advice. For those who like models, I'd like to add at least a starting point for a model... someone recently asked me about solar cells and battery charging, and I became interested in how you find the "maximum power" operating point for a solar panel. At least a first-order model for a solar cell is a (silicon) diode which is shunted by a current source. The current source is, of course, the result of the light shining on the cell. So, as some have noted, the open-circuit voltage of the cell won't be more than a "diode drop." In fact, the open-circuit voltage is just the diode voltage for whatever current is being generated from photons. There's an interesting result from this... if you have a panel with a number of cells with a load on it, if one of the cells is blocked from light, the current thru the load will be trying to flow in reverse thru that cell...and the current therefore drops to a very low value. Also, this model explains why you want a diode in series with the array when it's put across a battery to charge it: when there's no light, you have a series string of diodes across the battery, and they will likely be forward biased enough to cause a significant drain on the battery.

I'm sure people who worry about building controllers which maximize the power taken from a solar panel have more exact models than this. Maybe someone reading this can shine some more light on the subject. But if the diode model is accurate, then the max power point will be at a voltage not very far below the open-circuit voltage; much below that, they will look a lot like a constant current source.

The advantage of the rechargeable, Renewall battery is that since it is
alkaline it has a long shelf life and a higher terminal voltage. A typical
nicad puts out about 1.2v while the alkaline outputs 1.5 v. This might not
sound like a big difference, but in low voltage applications it might mean the
difference between a circuit working properly or not. In a series connection,
5 alkalines will do the job of 6 nicads.

# 4461. SWR Meter with external sensor capability: can I add 440 mhz capability

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-14 00:00:00 UTC
From: fakeaddress@spambuster.com
Message-ID: <64icvs$rh8$1@kali.ziplink.net>
Source record: 89146

I just bought a 440 mhz FM transceiver, and wanted to check the SWR of a couple of 440 antennas that were cluttering the junk box. I own a Daiwa NS 660A, which is a 1.6 - 150 mhz SWR meter. It has the capability to add an external sensor.

Can I build a sensor that will work on 440? Someone suggested that the UHF SWR meters have a shorter piece of wire between the two coax connectors.

Any ideas?

Thanks

Where did you get the idea that Class E amplifiers are linear?

They aren't. That's why you don't see them in general use.
Note that the QST Class E project was for CW only.

Presumably, a Class E amplifier (not this specific project) should be fine
for FM as well. Of course, i would wonder if something that switches at
50 MHz (not to mention 145 MHz) might not spend enough time fully saturated
to make it worth the difference in complexity.

# 4466. grounded collector 2N3055 in +12V PSU

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-14 00:00:00 UTC
From: LA8AK@nospam.thanks
Message-ID: <346cc4c6.6530252@news.online.no>
Source record: 89151
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Hi

I received some emails requesting this note. This is a repost, perhaps I chosed a bad subject the first time. The great advantage is that it is easy mount transistors without any collector voltage potential on the outside of a box (without mica insulation, but still thermal compound should be used). I have built 3-4 similar power supplies for different projects, with 1-3 transistors for current up to 10A. Only problem is that it is no good way to make current protection, voltage regulator overcurrent drop-out may vary dependent on case temperature - up to 2.5Ampere!

+12VDC from grounded collector 2N3055, this uses LM320T12 or MC7912CT - negative voltage regulator.

```
R (+)--|-------|------------|---------|-----(+12V out
E | | |MC |
C 4700uF 0u1 MYLAR |7912 |
T | | -----|----- |
I | | | gnd | 1000uF
F |- 22R--|------ |IN out | |
E | B -----|----- | LA8AK
R (-)--|-----E C----------| | 1976
| |
simplified circuit diagram ---gnd ----gnd
will work as shown, should be saved and read using EDIT
```

DO NOT CONNECT "negative side of rectifier" to GROUND!!!!! The voltage is floating.
+ side from rectifier carries +12V .
LM320T12/MC7912CT: "input" to 2N3055 base, "gnd" to +12V, "OUT" to ground
0.1uF between regulator "IN" and "GND" is important, otherwise bad oscillation in mediumwaveband will occur
Add 1N4002 diodes in series between regulator-GND and +12V to increase the output voltage.

Sometimes. They are like regular alkalines with slightly lower capacity.
They won't put out the current of NiCd or NiMH or LiIon batteries, but
they have the long shelf life of alkalines. Also, the Renewal chargers
are all intelligent fast chargers.

For more details, try http://www.bti.ca, the web site of the people
who developed the technology, and Ray-O-Vac's own web site. Lots
of technical details in both places.

> N9VEM

You won't find the bias current you need from the spec sheets. You need to find the exact value for your own circuit, perhaps by putting a pot in and finding the optimum value over the range of temperature and supply voltage you expect.

Both oscillators are very vigorous, so you won't need much bias. The transistor conducts for a very short part of the cycle, and the currents are much higher than the value measured with a dc milliammeter. You run a risk of overdriving the oscillator with that much supply voltage, so I'd first try values that just get the oscillator started.

I have successfully used a Colpitts at UHF with less than 1 volt supply voltage. With a 9 volt supply (I assume a battery), you have plenty to work with. You might try fixing the base voltage at some convenient value, and using a value of emitter resistance that will set the desired operating current. This will give you operation over a much broader range of supply voltage, temperature, and transistor parameters.

What frequency are you running? A 2N2222 is great for HF and lower frequencies, but if you are trying to reach VHF or above, you need a much faster transistor.

You might try modeling the circuit in SPICE. This can show how minor parasitic effects, such as stray capacity or inductance, can have a surprisingly large effect on the circuit performance. Try adding some inductance in series with the emitter and collector. For UHF and microwave, a nanohenry or so can have a dominating effect on the results.

This is pretty basic regulator design, but the reason it is very seldom used
is exactly as you indicate: The input (-) side MUST be floating with respect

to the output ground. Therefore this circuit is useless in many applications, and from a practical point of view, it is only useful if the input comes directly from the rectified output of a transformer (which is naturally completely floating).

The simplest wzy to do it, as long as you already have a shortwave receiver, is a upconverter. A low pass filter with a cut off below the broadcast band (so those strong local signals won't overload the mixer), a mixer of some kind and a crystal oscillator. Find a segment that your shortwave receiver can tune where there aren't any strong signals (so you won't have to worry about them feeding through), and get a crystal for the oscillator that is the same as the start of that segment. Or take a crystal you have and use the tuning tange that matches.

Thus, if you had a 3MHz oscillator, you would tune the receiver from 3.018 to 3.150 MHz.

The antenna feeds through the low pass filter to the mixer, with the crystal oscillator feeding the other input to the mixer. The output of the mixer feeds into the antenna jack of the receiver.

The actual details can be found in all kinds of places, and it's just a matter of putting them together.

I believe that this is pretty much the way most low frequency converters work. If you were to go to a tuneable front end, you'd have to have a lot of switching and a lot of coils, because while 3.018 to 3.150 is really a very small change compared to the 3 MHz, 18KHz to 150KHz is almost a 10:1 frequency range. A 2:1 frequency range is what you can expect, so you'd need a lot of switching to cover the full range.

This is an interesting thought. It got me to musing about the ways we look at feedback in amplifiers. When active devices were rare, expensive, and marginal in performance, we used positive feedback to get the most gain out of them we could. Of course positive feedback makes a circuit potentially unstable, and has us tweaking each circuit to accomodate component tolerances. That's a pain in a production environment, and is even a pain for a reproducible homebrew project. And component aging means we need operator adjustable controls to continue tweaking after the circuit is in use. That's usually undesirable, and can rapidly get out of hand as system complexity increases.

When active devices became more common, cheaper, and somewhat more capable, we turned our emphasis to negative feedback to try to tame and linearize them. A negative feedback system can be designed to be unconditionally stable, can be very tolerant of component variations, and thus can reduce the need for operator controls and production tweaks. We can plug almost any old active device into the circuit and get reproducible results. This is good when active device lifetimes are still measured in hours. The operator can replace the device and get back to operating without having to fuss with the circuit to get it to work correctly again.

And today when active devices are extremely common and cheap, thousands or millions to the package, are quite capable and linear, have extremely tight and reproducible tolerances, and have a reliability factor measured in decades instead of hours, we tend to ignore feedback altogether except as an undesirable stray we want to avoid in our projects.

Of course we still use feedback, but we use it at a different level than we did back in the days when active devices were rare, expensive, unreliable, and of loose tolerance. Today we tend to use feedback *systems* rather than feedback paths in individual circuits. Our level of abstraction has moved up the scale a notch as we concentrate on system function and system design rather than on circuit details addressed for us at the silicon foundry on a commodity basis.

This progression from art to engineering seems to me to be typical as basic technologies mature. We can build on this base to a higher level. Now the gain block, the filter block, etc become our components, and the system becomes our circuit.

---
You could probably use the same supply for both as long as everything
works ok, but there is a problem if the plate supply should disappear
for some reason and the screen supply were still connected. Excessive
screen current would flow and probably damage the tube. It would be
better to put a resistor in the screen lead to limit the current.

---

If you are using octal tubes, you can use the same sockets that are used for industrial plug-in relays. They mount on a flat surface and the only holes needed are two small ones for mounting. They are available from Allied, Newark, etc, and probably from your local electrical supply house. They look good and work good.

Source record: 89085

Yes, it sounds OK. I'll see if I can get one of those AD607s to play with. Someone gave me some fast ADCs I can use with my SHARC EZ-Kit DSP system for the IF processing and demodulation.

As you probably know, they have an evaluation board for the AD607. But if you do your own PC card, i'd be very interested. The EZ-KIP for the ADSP2181 ($90 last i heard) already has CODECs on it (and can operate stand-alone if you do your own PROMs). Would that be a good approach?

>the excellent state-of-the-art R2/T2 pair).

Ten-Tec also offers a transverter from 2m to 6m. So if you have a 2m multimode, this is a good way to get on 6m.

But Gary, the point of the question was to find some modest way for a non-HF operator to go towards all-mode operation. If i had a 2 meter all-mode, or could afford one, then i wouldn't be asking all these questions.

So i'm looking for something to minimal or basic to build to get beyond FM-only operation. The QRP community has lots of designs like that, i want to see similar quality reproducible projects for VHF or above. If my computer can decode it for me, i wouldn't even object to CW.

You might want to consider building a converter for an old scanner instead of a complete rcvr unless you have special needs. (I confess I'm not aware of what POCSAG is). You could probably get an old scanner at a real decent price as a lot of people seem to be unloading their old 16 channel 400MHZ units and buying new gear. If this is a single freq, one of the xtal rigs would work. Ramsey sells a converter kit for about $50 and I think this was written up in either Popular Electronics or Radio Electronics a few years ago.

>I have a 250 watt 12" resistor I want to use.

It won't conduct heat from the oil to the outside air very well, so the
long-term continuous power it could absorb would be greatly reduced.
Short-term power dissipation (in the oil) wouldn't change.

The metal can also provides RF shielding, while the pickle jar would
not. If the ground return for the resistor surrounds it well enough,
this may not matter.

>BTW: I may just hang a few neon bulbs in the jar to watch them glow!
>(Assuming the oil I use is clear enough - will they glow in oil, or will
>the oil absorb too much of the RF, or short the neon bulbs before they can
>charge?)

The oil shouldn't absorb the RF or short the bulbs - it ought to be a
very good insulator. However, if the resistor is completely surrounded
by its ground, there may be little signal to activate the neon.

Put a 12 volt light bulb in series with the power supply to limit the
charging current. When the light bulb goes out or gets real dim you
know
it's close to full charge.

> --

The battery is probably shot. A regular lead-acid battery is usually a goner if the voltage falls below 10 to 11 volts. I would expect the same of the gel-cell.

It's worth a try running it on the charger for a while, but don't be surprised if it doesn't revive.

I wouldn't put diodes in the lines. The voltage drop may prevent you from bringing the battery up to proper voltage even if it is still good. A low-value resistor or 12-V light bulb will moderate the current, and you can make rough current measurements by measuring the voltage drop across it (Ohm's Law: I = E/R). The resistance of the light bulb will go up if the current is very high (bright bulb), so the measurements won't be accurate, but they're cheap and easy, and they give you a rough value.

# 4498. WTB: Damaged Ant. Tuner Needing Inductor

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-15 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bcf17a$0b0f7dc0$0b8a92d0@bitnet.bit-net.com>
Source record: 89159

I am looking for a tuner, preferably with metering, that needs the inductor replaced and is thus low in price. It needs to be large enough to house the inductor described below.

Rotary inductor on 3.5" X 7" porcelain form. Coil is 23 turns of 0.125" dia. silver plated wire. Inductor is supported by a 4.5" wide X 5.5" high X 9.5" deep frame that is designed for chassis mounting. Shaft is 0.125" diameter.

Failing this, I am either going to try to hack my Dentron Super Tuner with this inductor (not sure it will fit), or (perish the thought) actually build a tuner from scratch ... if I can figure out the impedance range, get the correct variable cap(s), and find the right circuit .... hmmm.

> >: That's the problem with the regen, unless it is fronted with a good
> >: unilateral front end, it radiates madly all the time.

It may, depending upon whether or not it is receiving am or cw/ssb
signals. Properly set up it is NEVER radiating madly all the time
because it is set on the very edge of oscillation, where the actual
circuit current is quite low (weakly oscillating).

> >Gee, regens have kind of passed out of my vocabulary, but my recollection
> >is that a regen doesn't radiate...a superregen does. Have I just
> >forgotten?? I'm thinking of a regen as an RF amplifier with positive
> >feedback below the point of oscillation, with something to detect the
> >RF amplitude in its tank, and a superregen as a gated oscillator, where
> >the amplitude of the osillation at the end of the gate time is
> >proportional to the RF (signal level) in the tank at the start of the
> >gate.

Both regenerative and superregenerative detectors will oscillate and
radiate, if improperly designed. Superregens are oscillating more
heavily and with more power than a simple straight regenerative detector.

> If AM is your game, you're right Tom, the regen is kept at the point
> just before oscillation sets in, which can be darn hard to do, and the
> howling when it falls into oscillation can blow the cans right off your
> ears. But if you're receiving SSB/CW, then you have to deliberately
> put it into oscillation to demodulate the signal. Since you won't find a
> lot of AM on the ham bands today, your regen will be operated as
> an oscillating detector.

A proper regen detector will not howl.

A proper regen detector will transition into oscillation as smoothly
as a hot knife through butter, with no howls, pops or squeels. If it
doesn't, it is not set up or designed correctly.

> Because the regen was hard to maintain right at the edge of oscillation
> (because a signal can pull it over the threshold), the superregen was
> developed. It has a quench circuit which forces the oscillating stage
> to quench back out of oscillation at an ultrasonic rate. That avoids
> some of the pulling problems and makes adjustments less critical.
> Of course it radiates like mad too.

A proper regenerative detector will be quite easy to maintain on the
critical edge of oscillation. It will also pull extremely little,
or none at all if the input coupling is correct. ANY pulling or squegging
of the oscillating detector in and out of oscillation is the mark of an
improperly designed or excessively overcoupled regenerative detector.

Source record: 89164

I agree about the battery probably being bad if it doesn't come up to 12V. I assume that you need a 12V battery. Some of the little garden tractor, motorcycle batteries, etc. really do work good to run radios. Of course, you have to be careful about the acid and gas. They sure are a cheap source of lots of power. Good Luck.

> >:-)

Actually, you can, quite effectively, if the set is overcoupled into the antenna system. It was common practice in the 1910's and 1920's to use a regenerative detector in heavily oscillating condition as a transceiver. Such a set is described in Radio Broadcasting (1922 or 1923 issues), using a 5 watt J tube as the detector and oscillator in a small portable transceiver. The Japanese did this quite effectively in their low vhf field pack sets of the 30's and WWII era. Hams used the technique in qrpp sets of the era, also. Recent experiments using transmitting tubes, by myself (6L6, 801, 807 and 211 tubes), and by a ham in Texas (833 tube) demonstrated that the transmitting tubes make fairly decent regenerative detectors, in addition to low power oscillators on 80M. It just takes some working with the circuits to get them to function effectively, without unnecessary stray radiation, safely.

As to relative quietness, a good regen set is as quiet as the best of the DC sets, and infinitely less noisy than the average late-model synthesized sets, which are abominable hash generators, quite often.

> Noting the smiley, if you must send CW, you can do it with the DC
> receivers too since their LOs are on frequency, but only when you want
> to, and not all the time. That's the problem with the regen, unless it
> is fronted with a good unilateral front end, it radiates madly all the
> time. (DC receivers can radiate too, if they aren't designed properly,
> but a good DBM does offer some isolation not present in the simple
> regens.)

I will have to take some issue on this one, since I do build and use exotic regen sets on a par with the best, and have for almost 30 years.

Simple sets of all kinds are generally not that good. But, a simple, yet properly built regen detector set without audio amplifiers will outperform its DC counterpart, anytime, even if the DC recevier has one stage of AF incuded of reasonable gain. The DC receivers often provide more gain, in the audio, but are rather poor in selectivity, by comparison, to a good regenerative detector. A detector and one-step audio vacuum tube regenrative set, typical of the simple sets, still will have sufficient gain to make headphone reception uncomfortable on, for example,

W1AW broadcasts. A 3 stage set will provide small loudspeaker volume, equivalent to a good IC audio stage on a DC mixer.

The average power out of a properly designed regen, properly coupled into the antenna system is of the order of a microwatt or two. Locals with top of the line antennae and receivers can barely pick up (on occasion) a regen signal from a few hundred feet away. Receivers in the shack will pick up the local radiation in unshielded sets, but little in properly shielded ones, even without an rf stage, if the antenna system is properly coupled into the detector.

If it is more than that, you don't have a properly designed regen receiver. Almost all of the traditional amateur designs seen in post-WWII and much of the pre-WWII literature are woefully overcoupled, and hence radiate more than they should. Many are unshielded or partially shielded, and running plate voltage of the order of 150-250 volts, which increases radiation, unnecessarily. A proper regenerative detector works best with vacuum tubes at around 15-24 volts on the plates. Commercial practice in RCA receivers of the best quality, rarely uses more than 20 volts. The typical feedback circuit current should be a ma or less. Grid coupling to the detector from the secodary circuit is best done with a grid bias resistor (grid leak) of 10 or more meg ohms coupled with a grid input capacitor of about 10-20 pf, maximally. That further will serve to isolate the antenna circuits from the plate section of the tube. Usual practice in poor sets is to use a 1 meg ohm grid leak and a coupling capacitance of up to 250 pf, which is much too high. With properly uncoupled primary/secondary coupling and good shielding, the thing will not be heard much even in the shack. The uncoupling and the high grid impedance will significantly increase the selectivity over that of a DC front end.

Direct conversion receivers, without isolating rf stages, are usually orders of magnitude greater in antenna radiation than a proper regen set. Good DBM ``detectors'' help to reduce such radiation due to conversion oscillator leakage into the antenna, agreed. Direct conversion receivers usually use a much higher level of oscillator injection than do any proper regenerative receivers. That also increases the magnitude of the oscillator leakage.

When both have rf stages for isolation, the radiation is basically nil on both, if properly shielded.

If one has not built and used properly designed homebrew and commercial regen receivers (and I am inferring marine service quality), one does not have a proper comparative basis. Everyone puts regens down, it seems, until they have actually used a good one in commercial or amateur service. Properly built and run, they are extremely sensitive, and will slice the sideband off an SSB signal, down into mush. DC receivers, in general, can't even come close.

Well, Squires Sanders tried them out, and they work just fine if you keep them away from magnetic fields. (They will not live in the presence of a flourescent tube ballast) They're also pretty hard to find anymore.

You can probably not do better than Colin Horrabin's "H"-Mode mixer built around the SD-5000 Siliconix (Now Temic) chip. Driven with square wave LO, I'm getting +55 Ip3. Those kinds of numbers put your problems elsewhere than the mixer. Like LO noise and Ip3 of the filters themselves.

>
>W4ZCB
why?
it is 3.5-7MHz! I have almost the same gain after the TX mixer in my
6M transverter....and still, no problems, no spurs.. 2N6083 (or
2N6084) has 19-20dB gain on 50MHz, but it is only one of the stages.
47dB in two stage PA on 80m is easier to tame than 20dB in one stage
on 50 and 144MHz.

Message-ID: <01bcf24c$2f19fd80$0f8a92d0@bitnet.bit-net.com>
Source record: 89098

Would it be OK to put a KW dummy load in a large glass pickle jar?
Other than the risk of it being broken by contact and the glass and oil making a mess, any other concerns?
I have a 250 watt 12" resistor I want to use.

BTW: I may just hang a few neon bulbs in the jar to watch them glow!
(Assuming the oil I use is clear enough - will they glow in oil, or will the oil absorb too much of the RF, or short the neon bulbs before they can charge?)
Thanks!

Yeasu had the 7360 in their FT400/401/500/505 shortwave transceivers
some 20 years ago. The tube was not in the receiver but in the
SSB balance modulator. I never understood this design decision.
An exotic part for a trivial job. (ok, it works.)

I still have a FT505 and one spare tube. (still qrv!)
Prices for the 7360 are outrageous if you can get them at all.

SD210/SD5000 is definitely the way to go.

Reprinted from from The ARRL Letter Vol 16 No 45

* Bogus bulbs? Merit Arnold, W6NQ, of RF Parts in San Marcos, California, asks in an Internet posting if anyone has encountered counterfeit high-power transmitting tubes (eg, 3-500Z, 3-500ZG, 4-400 series) at flea markets or through overseas suppliers. He says that since Eimac left the glass tube business, he's learned of instances where Eimac and Amperex logos and cleverly copied markings or labels have been applied to tubes manufactured in China which are then packaged in yellow Eimac-style or Amperex boxes. Arnold says that recent-issue Eimac 3-500Z/ZG tubes will have the Eimac logo imprinted on the grid shroud. Also, he says, Eimac will usually have the serial number engraved with vibrating pencil on the shroud. On the other hand, the counterfeit overseas tubes will have the date code and serial number stamped along the edge or on top of shroud (first two digits indicating year of manufacture). Counterfeit 4-400 series "Amperex" tubes use a "slip-on" anode terminal with a set screw. Genuine Amperex tubes have the terminal fused through the glass. W6NQ would like to hear from anyone who has run into these bogus tubes. E-mail him at rfp@rfparts.com.--thanks to Marv Gonsior, W6FR

Later Yaesu models had a solid state replacement board for the 7360
balanced modulator, was described in the Dutch 'Electron' magazine
some years ago.

I've used the NE602 successfully in DSB transceivers at HF, though they should work on 50 MHz but I haven't tried it. I still think the best starting point is to use a VXO (which should give 50-100kHz shift on 50 MHz) and build a direct conversion DSB/CW transceiver. I would suggest the following:-

VXO
---

VXO: any dual gate mosfet
buffer: 2N2222A, etc

Receiver
--------

RX preamp: BF981
Rx detector: NE602
AF preamplifier: LM301, 308, 741, etc
AF filter LPF 3kHz (optional) 741, etc
AF amp CD4007 (biased to linear operation) or LM386.

Transmitter
-----------

Speech amplifier: 741
Balanced modulator: NE602
RF amp stages: 2N2222A
Driver: 2N3866/2N4427
PA: 2N3553

You might be able to get up to 1-2 watts out of this arrangement, though I haven't tried it.

An NE602 oscillator/mixer chip (preceded by a 200kHz LPF) and a crystal
of appropriate frequency for the receiver being used should do it. The
NE602 data sheet should provide enough info.

Dear radio hobby club volunteer:

FBOM Magazine Online, the interactive version of FBOM Magazine, is offering to post information about your non-profit radio club's hamfests, jamborees and other large radio hobby-related events free of charge on our web site (http://n-lemma.com/FBOM/).

The only strings attatched are that your club is a non-profit organization and you can use some extra publicity.

These listings will be continously updated. As an added incentive for others to rely on the listings, we will contact you 2 weeks prior to your event and put a "Confirmed or not confirmed by FBOM" stamp on the listing.

Please send us information about your club's fundraising events as soon as possible. You can also use a form on the our web site. Simply click any references to "Hamfest listings."

For any questions, email the Publisher, Eric Bond, N9VJG (n9vjg@n-lemma.com) or the Webitor, Chuck Brown, N9UPO (n9upo@n-lemma.com).

Feel free to spread the word to other radio hobby-related clubs and organizations--especially those who do not have internet access.

Thank you and 73s

Eric Bond, N9VJG W.C./NCI-1099

>I have a 250 watt 12" resistor I want to use.
>
>

I can see at least two problems:

1. It would be nice if your dummy load was SHIELDED to prevent (or at least lessen the possibility of) interference to other stations nearby (and maybe not so nearby)

2. It is usual practice to have a dummy load kinda close to 50 ohms since you want all the impedances to match: Rig, feedline and load. Is this a special case where you don't need a 50 ohm load?

I double-checked the calendar and this ain't the first (of April or any other month), but there was a full moon recently. Sometimes I get a little too serious. Is this one of them?

Regards,

Bill

Here it is:

http://sss-mag.com/smith.html

I have used it and it really is a nice application. It takes
a little getting use to but once you do, you can mess around
with you parameters very quickly and see them move through
your band of interest. Remember, the lower the Q the broader
the bandwidth, stay away from the outside of the circle.

Best, Dan. http://www.lakeweb.com/dbLabs/

## 4533. high level tube mixers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-17 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <346FCC53.C8C29A5F@tri.net>
Source record: 89022

The 6JH8 is a better tube than the 7360 in some respects and is still found on some tube order sites and at hamfests for reasonable money. Both are microphonic to some extent also, but the conversion from one to the other shouldn't be a major problem.

One advantage of the tubes is the the NF of the tubes should be lower than other mixers if that is a consideration. The downside is that the tubes can put out a watt or so into the following filter if things go wrong. I still use one in a homebrew 160 rx and can't see much (unmeasured) difference between it and a MCL SAY mixer.

# 4535. Matching sweep tube for use in RF applications.

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-17 00:00:00 UTC
From: robertc908@aol.com
Message-ID: <19971117084601.DAA06233@ladder01.news.aol.com>
Source record: 89024

Does anyone have experience at matching sweep tubes for use in parallell RF amps. I have read a couple articles saying the proper method is to place a single tube in the amp at a time and observe parameters to pick a matched pair. Others have advised that they were matched using transconductance/mutual conductance using tube testers. Anyone out there having used either or both methods advise their results.

Thanks
Bob, W4RLC

> 73 Simon GM4PLM

1) There is a general lack of good design work across the world and across the whole range of amateur radio. Editors of every periodical I know in the US, UK, and everywhere else, are actively seeking anything even vaguely publishable. There may be no alternative but to decide on a few deeply needed projects and to commission some good quality design work. Perhaps some design competitions could help to stir up activity? The amount of homebrewing seems to have both shrunk and focussed on the really easy things. There are still some outstanding things being done, but they has become much rarer.

2) I've met a number of past-authors of RSGB publications. Some of them were voluably unhappy with the experience, and this has contributed to a suspicion that the RSGB might not be a good publisher to deal with. I contributed a chapter to the 1995 ARRL handbook and found the ARRL very friendly and easy to deal with. I have since been approached by the RSGB about writing a chapter for a book of theirs. I would have had no qualms had a similar request come from the ARRL, because of my pleasant experience with them, but the reputation of the RSGB worried me. I worried too about whether I was over-reacting and if it was just due to a few people who were suffering some bouts of sour grapes about something real or imagined.

It seems that effort is being expended at Potters Bar about making the RSGB more attractive to authors, to attract some new ones, and to win back some old ones. Without a supply of material, their publishing activities will cease, and a significant source of income will end. Since the recruitment of Perer Kirby there seems to have been an outbreak of pragmatism in Potters Bar, and things have started to appear more open. Ian White, G3SEK has been involved in pointing out the changes needed to be competitive in attracting technical articles. Good technical articles, especially projects, are in very short supply, world-wide, and it's a highly competitive global market.

From conversations with some past authors, I can say that there is some truth in your second statement. From personal experience I can say that things seem to have gone well for me, so far.

Cheers
David GM4ZNX

>>LarryC wrote:

>I'm evaluating a hi-level balanced tube mixer for a hi-dynamic range
>receiver to be designed. I'd like to use the 7360. Circuits abound but
>has anyone actually built and checked them out?

I've been using a homebrew 12 tube receiver using the 7360 in a single ended mixer for several years now. Only trouble is, don't have the necessary test gear to evaluate and optimize the design, so have to depend on operating experience. I want to try a balanced design in my next receiver project, and I'm very interested in anything you uncover.

The 7360 is actually considered a TRANSMITTING tube by RCA, who developed it. They were popular in SSB rigs of the '60s because one bottle could serve as carrier oscillator, balanced modulator, and receiver BFO.

As a mixer, the 7360 has very good overload characteristics - it takes over a volt to overload, and you can get 20 dB conversion gain and a low (5db) noise figure. In severe contest conditions it really stands up well. If you haven't seen them already, I recommend the following articles:

"A New Approach to Receiver Front End Design" William Squires, W2PUL QST, September 1963

"Some Thoughts on Home Receiver Design" By Goodman, W1DX QST, May 1965

"An Advanced General Coverage Amateur Receiver" John Pitts, W6BD QST, November 1970

"An Experimental Receiver for 75 Meter DX Work" Doug Blakeslee, W1KLK QST, February 1972

To my knowledge the only commercial receiver to use the 7360 as a receiving mixer is the Squires Sanders SS-1R. There was an article about it in Electric Radio about a year ago, but no circuits or construction data. By all accounts this was a truly fantastic receiver, but it was doomed by its high price tag and lack of a matching transmitter - it could not compete in the amateur market with the Collins S line.

Although Imay be killing the goose that laid the golden egg, there is another beam deflection tube you may wish to investigate. The 6JH8 is a later design, and its price is reasonable.

Will send more as I dig it up

You didn't mention whether you cut the trace like the mod indicated. I
am not familiar with that particular mod or radio but have been
successful with other mods and radios. Check and re-check your work. My
experience has usually shown that is where the problem is.

Good Luck, Tom KE4DSK

Perhaps the easiest is to use SBL-1 with 3.5MHz xtal oscillator
feeding LO input..
input on pin 3-4 and output on pin 1
a coupling capacitor and a 200kHz lowpassfilter is an advantage
between antenna and SBL-1 input, it is 50 ohm on all ports so you
don't need any matching circuits

Join the G QRP Club, the magazine has several circuits for 73kHz and
similar frequencies. www.gqrp.demon.co.uk

Not necessarily. A VXO can do just fine. The old IC202 and IC402
covered the 2m and 70cm sat bands with a VXO. Sufficient range
can be achieved. Sufficient stability can be achieved. And there are
no synthesizer artifacts to suppress.

> Also, the 74AS161 counter is spec'ed at 75 MHz. Could a
> 74AS04 be made into a 6 meter VXO and/or QRP CW transmitter?

Probably not. For one thing, a ring oscillator is very noisy.

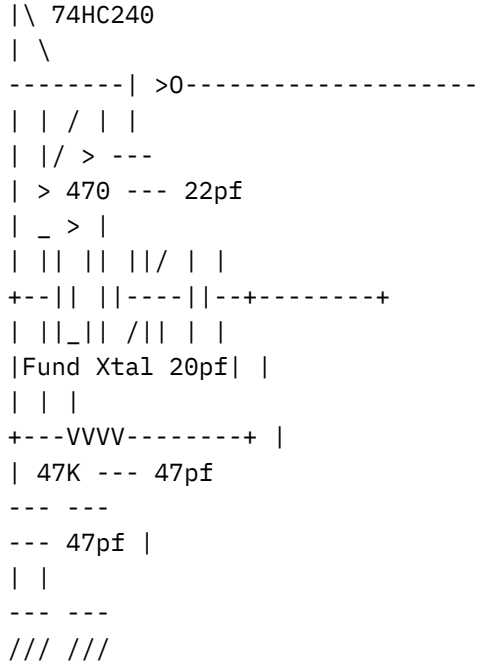
For another, you are constrained to an odd number of
inverters, starting at three.

If the prop delay of a single inverter is 2 ns, you can
generate oscillations with a period of 2ns * 3 = 6 ns (166
MHz), 2ns * 5 = 10 ns (100 MHZ), and so on. You would have a
hard time finding a particular ic that had the right
propagation delay to generate the desired frequency.

You also have to find some way of adjusting the frequency.

This is usually done with an rc network between inverters,
perhaps controlled with a varactor. It can be done, but the
results are terrible due to poor frequency stability and
excessive jitter. It would be better to use a Colpitts.

OK, i guess you don't follow what i was suggesting. In the 1996
ARRL Handbook, p. 17.100, "An Experimental 1/2-W CW transmitter",
a 74HC04 is used on 10m, 15m, and 20m:



It uses three sections in parallel, nominally 150 ohms, to get 50 ohm
match. It is keyed by slowly enabling the three drivers, the oscillator

is left running when the transmitter is enabled (no QSK??).

Does this function as a VXO, and can it run faster the 10m with a different driver IC?

74AS240: t : 2 - 6.5 ns, t : 2 - 5.7 ns.

KK7B describes a cute VHF VXO in the May 1993 QST - this is the
R1/R2/T2 follow-up/integration article, reprinted in QRP Power.
It works well; I've built both ugly and SMD versions and they
seem idiot proof. They're stable, too.

The key components are a 74HC04, a MAV-11, several Toko MC-122
inductors and a crystal (parallel resonant, 10 pF load capacitance,
1/7 of the output frequency). Expect 50 kHz or so tuning range.

# 4548. 1 KW Automatic HF Antenna Tuner Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-17 00:00:00 UTC
From: Roger Palmer <rpalmer@islandnet.com>
Message-ID: <01bcf3b0$bc6bb420$3fac35c6@Roger.islandnet.com>
Source record: 89037

I am looking for an automatic antenna tuner for my boat. It will be driving a non-resonant inverted L antenna with a total length of about 35 feet. Ground will be directly to the hull of my steel boat. My Icom AH-2 works beautifully, but it cannot handle more than 100 Watts. I am adding a 1 KW linear amplifier, and I need something that can accomodate this power level.

I have been spoiled by the AH-2, and want a truly automatic unit. SGC makes a tuner, but it can only handle 500 Watts. A surplus unit is the most likely candidate. I have come across a naval surplus tuner using motor driven roller inductor and vacuum variables - this would be perfect, but the current owner doesn't want to sell.

Operating voltage can be 12 or 24 VDC, or 120 VAC. The unit will be mounted outside.

I would prefer not to have to build it myself, but this may be the ultimate solution. Any ideas?

>
> -Kevin Ames
> mtnclimb@aol.com

SPICE has its problems. One of them is that it does not like nodes without DC connection to the rest of the circuit. The usual solution to this is to add high valued resisters to the schematic to tie the floating nodes to something, usually ground. I normaly call these (for obvious reasons) RDUMB1, RDUMB2, etc. The resister value is chosen is to be a very high value (like 10^15 Ohms) so it otherwise acts like an open circuit. One of the nice things about computers is that they don't know that this is an impraticical value.

You will find that the AC analysis mode in SPICE workes well. However, most SPICE programs do not do well when trying to perform transient analysis on narrow band or very high Q circuits. I am not an expert as to why, but it apparently is due to the fact that in narrow band circuits, the small matrix errors remaining at the end of each time step are significant.

From: John Mock <kd6pag@nospam.mocha.ecofe.com>
Message-ID: <4mk9e6hl0a.fsf@spinner.ecofe.com>
Source record: 89042

I have the regen article, but missed the superregen one. It was interesting that people complained in the letters column about one or both of them, on the basis that it was "outdated technology".

Actually, the 1996 ARRL Handbook has a project called "A Regenerative Receiver for Beginners" (pp. 17.68-17.72), but it doesn't seem to me to be that much of a beginner's project, as it involves nearly 50 parts with no PC board or even a suggested layout. It does have two JFETs between the antenna and the oscillator, so the customary complaint about potential RFI has been addressed. It's frequency range is 1.6 - 25 MHz (with the three plug-in coils).

My complaint is:

Space limitations do not permit us to show a companion super regener-
ative receiver for VHF and UHF bands. If you're interested, look at
"The Lost Technology of Super Regeneration" by Charles Kitchin in the
Fall 1994 _Communications Quarterly_.
[1996 ARRL Handbook, p. 17.72]

Alas, it appears that the vast majority of projects in the 1993 ARRL Handbook are either HF or CW oriented.

David,

First, you won't get a *stable* oscillator (as in crystal) at that
frequency.
An LC oscillator probably won't be stable enough.
You could use a SAW element in place of a crystal in that frequency
range (if you can find one and afford it).
You could use a multiplier chain. You could design a simple PLL.
Or, if you have a little more money than time, you could just
buy one from MicroNetworks. They make lots of low jitter, stable
oscillators in that frequency range. They have ECL output levels.

The only thing I've read is that LiIon cells are fussy, and require
supporting circuitry specially designed for use with them. They don't
like being overcharged, and they don't like being discharged too much
either. Apparently it's normal to have electronic monitoring of both
charge and discharge to keep the cells out of trouble. Since the things
can catch fire if abused, this is a serious issue.

# 4558. **PLEASE HELP WITH RS HTX-100 MOD****

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-17 00:00:00 UTC
From: hamuser@aol.com
Message-ID: <19971117024200.VAA06249@ladder02.news.aol.com>
Source record: 89119

Hi there.

I found a mod for the Realistic HTX-100 which allowes 26-30 MHz, but when I did the mod, it did not work. Here are the details. But first, here's the mod I got:

>Remove bottom cover. With the radio upside down and display facing you remove >the synthesizer board with the four screws, this is near the front of the radio.

>This gives access to the small board underneath with the surface mount >components on it. Locate the processor chip IC401 (UC-1208).Locate pins 28 >and
>29 which are on the right hand side of the chip and are 4th and 5th from the >top. Note they are bridged with solder.
>CAREFULLY cut the copper track NEXT to the pins. DO NOT attempt to >unsolder the two pins form the board. Use a GROUNDED soldering iron. Locate >the two rows
>of connector pins above the chip. On the bottom row locate the last pin on the >right. Verify with a VOM that this
>pin has + five volts. Solder a 10k (1/4 w) resistor between this pin and pins >28 and 29 on IC401.The synthesizer will now tune from 26.00 Mhz to 30 Mhz.

Ok, here's what I did: I found pins 28 and 29 on the IC401 (UC-1208), they were bridged together with solder, as it said. I took a 10k resistor and soldered it between pins 28 and 29 and the last pin on the right lower connecter row. I powered the radio up, and it works as usual. I don't get the expanded range, it just covers 28.000 - 29.699 MHz as it does normally. There was absolutly no change at all. Should I reset the radio after the modification? It seems like nothing changed! I am also looking for the schematic for this radio. If anyone can help with either problem, PLEASE HELP. I would REALLY APRICIATE any ideas that you might have on what may be wrong. Please email me. Thank you very much.

73's,
N3ZVM

## 4559. IBM 3191 for packet radio?

Newsgroup: rec.radio.amateur.homebrew

There's no channel 83. That's part of the cell-phone allocation
now, and they would have no sense of humor after tracking down an
interference complaint. Even if they didn't notice, it's in the base
station side of things, so you'd be dealing, in any urban area, with a
ton of interference to your signal. (Beyond the fact that it's against
FCC regulations to have low power transmitters in the TV broadcast bands.
The legal stuff runs in 902-928 MHz).

on recent devices.
>
>
Yes, it's a quad dmos switch, identical to the SI/SD-8901 except in a 16 pin
DIP package and the mask was such that it does not have the VHF response that
the 8901 has. At HF, there's nothing that will touch it. Cost about 2 bucks,
and in passive transmit mixer will deliver +10 dBM with carrier and IMD 60 dB
down from EACH tone. In receive, in Horrabins circuit where the signal is not
in the switched path and with square wave drive, about 8-9 dB insertion loss,
+56 dB Ip3 and 50 ohms everywhere.

Try using dummy resistors of a 10^12 Ohms or something like that
so that no nodes are without a DC path to ground (spice doesn't
care how little current flows, just that there is a "DC path to
ground" from every node.)

You might try the siemens TDA 6060XS IC.It does it all on one chip.

50 to 950Mhs oscillator, Audio and viseo midulator, multistandard.

Norman

# 4570. WANTED: 10m xtal rig schematic

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-18 00:00:00 UTC
From: jhetheri@freenet.npiec.on.ca
Message-ID: <64r7n8$3mb$1@brain.npiec.on.ca>
Source record: 89051

As I search thru my small library of schematics, handbooks and the like, I cannot find a schematic for a simple, minimalistic type 10 metre xceiver. 40m circuits abound, but 10m seems hard to find. Anybody have any suggestions? With 10m's best days ahead, a simple 1/2 watt CW xceiver could have a little fun!

Tnx es 73/72

You are correct - I didn't notice the original post only needed 200 KHz.

Also, I am more familiar with the commercial term "VCXO". These are Voltage-Controlled Crystal Oscillators, where the frequency control is a DC voltage, rather than a tuning shaft on a variable capacitor. They are usually spec'd for +/- 100 ppm, but some may go as high as +/- 200 ppm.

The frequency stability is considerably poorer than standard crystal oscillators, but they may be usable for ham work. They are certainly better than a free-running LC oscillator, and you are right about the spurs from a PLL.

> E-MAIL ME ANYTIME! THANKS,<ART>

Very simple, you just buy an AUX-7 board (now a rare item), get the little diode array IC's from Mouser or similar, cut off exactly the right pins, install them in the board, open the TR7, and plug the AUX-7 in under the display board.

Or if you can't get an AUX-7, you can build one from the QST article from around 1980.

If you plan to use it on AM, you need to get the 6khz filter, also a rare item.

BTW, it is illegal to use it on CB in the US.

73,

Geoff.

Sorry - the calculations above are for one-half period. The actual
frequency should be divided by two. Of course, I was way off
understanding what you were talking about, so the point is moot anyway.

> You also have to find some way of adjusting the frequency.
